**A  
BIBLIOGRAPHY  
OF  
ECONOMIC AND COST ANALYSIS**

**MARCH 1972  
DEPARTMENT OF THE ARMY**

Prepared by

*Comptroller of the Army*

*Directorate of Cost Analysis*

*Washington, D. C.*

A  
BIBLIOGRAPHY  
OF  
ECONOMIC AND COST ANALYSIS

Prepared by: Department of the Army  
Comptroller of the Army  
Directorate of Cost Analysis  
Washington, DC 20310

March 1972

## User's Guide

This bibliography has been prepared to serve as a quick reference source for materials available in the areas of economic and cost analysis. Entries are arranged in alphabetical order by title. Additions will be inserted in order and page indicators assigned alphabetically (for example: 9, 9a, 9b, 10). This will allow additions to be made as more materials are published. Entries are organized in the following

format:

- title (and subtitle)
- author(s)
- place of publication, publisher, year of publication,  
number of pages
- reference numbers
- abstract, summary, or brief description
- breakdown by chapters or divisions

The reference numbers include, wherever possible, the AD number, to facilitate ordering the document from the Defense Documentation Center. The breakdown by chapters was used to allow quick referencing of the topics covered in the work. Indexes are indicated to allow a more detailed search for specific items of interest.

The index at the end of the bibliography gives entries, by page number, of some of the most frequently referenced topics.

## Instructions for Ordering Publications

When available, the Office of the Director of Cost Analysis makes an initial distribution of new Economic and Cost Analysis publications which are sponsored by the Office of the Assistant Secretary of Defense or Department of the Army. The Director of Cost Analysis does not stock extra copies of these publications after the initial distribution has been completed. Many of the publications described in the attached Bibliography may be ordered from the Defense Documentation Center (DDC), Cameron Station, Alexandria, Virginia 22314. When ordering from DDC, cite appropriate AD number if available, and include appropriate payment. The service charge for most of the current publications stocked at DDC is \$3.00.

This Bibliography was prepared primarily for reference purposes and it is not intended or implied that every Economic and Cost Analysis Office should have access to all of the publications listed. The following publications are endorsed by the Director of Cost Analysis, Office of the Comptroller of the Army:

Cost Considerations in Systems Analysis  
Fisher, Gene H. (Rand Corporation) (Page 27) (Note 1)

Costing Methodology Handbook  
Directorate of Cost Analysis, Comptroller of the Army  
(Page 43) (Note 2)

Guidebook for Systems Analysis/Cost Effectiveness  
ARINC Research Corporation (Page 90) (Note 3)

An Introduction to Equipment Cost Estimating  
Batchelder, C.A.; H.E. Boren; H.G. Campbell; J.A. Dei Rossi;  
J.P. Lingo (Rand Corporation) (Page 99) (Note 4)

Note 1: Initial distribution has been completed. Publication is not available at DDC. Authorized Government Agencies may obtain publication from RAND Corporation. Textbook may also be purchased from the American Elsevier Publishing Company, Inc., 52 Vanderbilt Ave, New York, N.Y. 10017.

Note 2: Initial distribution has been completed. Publication is available at DDC.

Note 3: Publication is available at DDC. Publication is also available as AMC Pamphlet AMCP 706-191, entitled: "Engineering Design Handbook - System Analysis and Cost-Effectiveness", April 1971.

Note 4: Available from RAND Corporation or from DDC. It is planned to update this document and republish it in loose-leaf form. Initial distribution will be made when it is received.

Analysis for Financial Decisions  
Beranek, William

Homewood, Richard D. Irwin, 1963, 480 p.

The objective of this book is to provide the student with a basic framework for the systematic analysis of financial problems. To this end, we seek (a) to set forth the central issues involved in the fundamental problem areas of financial administration, and (b) to develop tools, techniques, and insights which are relevant and useful for solving these problems.

- I. Introduction.
- II. Goals, Decisions, and Models.
- III. Rationing of Resources: Single-Period, Single-Product Projects.
- IV. Rationing of Resources: Two-Product Projects.
- V. Rationing of Resources: Multiple Periods.
- VI. Multiple Period Projects: Risk and Uncertainty.
- VII. Supply of Resources.
- VIII. Long-Term Financing and Maximizing the Market Value of Common Stock.
- IX. Capital Structure and Risk.
- X. Receivables and Credit Policy.
- XI. The Cash Balance.
- XII. Simulation.
- XIII. Linear Programming and the Simplex Method.
- XIV. Multiperiod Analysis and Linear Programming.
- Appendix A. Cumulative Normal Distribution.
- Appendix B. Table of Random Numbers.
- Index.

**Analysis for Military Decisions**  
Quade, E.S. Editor

Santa Monica, The Rand Corporation, 1964, 382 p.  
Rand No. R-387-PR. AD 453 867.

A report prepared for United States Air Force Project Rand; Concerned with the origin and development of the systems analysis approach and its relation to national security planning, the elements and methods common to all systems analyses, and special aspects. Part 1: orientation (chapters 1-3); Part 2: elements and methods (chapters 4-8); Part 3: special aspects (chapters 9-16); Part 4: summary (chapter 17).

- I. Introduction (E.S. Quade).
- II. Analysis for Air Force Decisions (C. J. Hitch).
- III. The Selection and Use of Strategic Air Bases: A Case History (E. S. Quade).
- IV. The Why and How of Model Building (R. D. Specht): relevant factors; quantifiable factors; aggregation; quantifying relations between elements; model building and the real world; human judgment.
- V. Criteria (R.N. McKean).
- VI. The Relevance of Costs (Malcolm W. Hoag).
- VII. Analysis and Design of Conflicting Systems (Albert Wohlstetter).
- VIII. Methods and Procedures (E.S. Quade): formulation; search; explanation; interpretation.
- IX. Technological Considerations (R. Schanberg): performance parameter; state-of-the-art parameters; scaling laws; optima and constraints; reliability considerations.
- X. Assumptions about Enemy Behavior (T.C. Schelling).
- XI. Gaming Methods and Applications (H.G. Weiner).
- XII. Strategies for Development (W.H. Meckling).
- XIII. Mathematics and Systems Analysis (E.S. Quade): linear programming; Monte Carlo; theory of games; the computer; the role of mathematics.
- XIV. The Use of Computers (Paul Armer).
- XV. Costing Methods (G.H. Fisher and the Staff of the Rand Cost Analysis Department): individual systems; investment costs; operating costs; R&D costs; total force structure; incremental costing and long-term programming; mission and other levels; sensitivity, timeliness, and clarity; cost categories; cost-sensitivity analysis; presentation of results.
- XVI. Pitfalls in Systems Analysis (E.S. Quade): formulation; search; explanation; interpretation.
- XVII. Recapitulation (E.S. Quade).
- Appendix A. An Introduction to the Lunar Base Problem (R.W. Paxson).
- Appendix B. A Minute Comparison (E.S. Quade).
- Bibliography.
- Index.

**An Analytical Estimation of System Cost Uncertainty**  
**Schlenker, George**

Rock Island, US Army Weapons Command (Weapons Operations Research  
Office), 1967, 28 p.  
Technical Note 67-3.

**Abstract:** "The method proposed for producing a probability distribution of system cost requires that the system cost be a sum of component costs each of which is uncertain. These uncertain inputs are assumed fit by beta distributions. The statistical moments of the distribution of system cost are obtained from the moments of the input distributions by a recursive procedure. Finally, the system cost distribution is synthesized from its moments using orthogonal polynomials. This method is quite efficient for computer operation and avoids lengthy Monte Carlo runs. An example is given. The FORTRAN program is given."

**Abstract.**

**Glossary.**

**An Analytical Estimation of System Cost Uncertainty.**

**Types of Beta Distribution Used in Costing.**

**An Example.**

**An Annotated Cost Analysis Bibliography**  
**Cost Analysis Division**

Fort Monmouth, US Army Electronics Command, 1967, 216 p.

"The purpose of this publication is to make available to management and cost-oriented analysts, information about documents catalogued in the Cost Analysis Division, Comptroller and Director of Programs, on the concepts and techniques of cost analysis. To expedite this objective, brief summaries have been provided for each document. Listed documents are available to all members of this command for research and reference purposes."

- I. Indexes: numerical listing; alphabetical listing; subject listing (guidelines and orientation, cost estimating relationships, systems analysis and cost effectiveness, mathematical models and applications, tables and cost data).
- II. Synopses.
- III. Bibliography.

**An Application of Dynamic Programming to Cost-Effectiveness Studies**  
**Sacco, William; Palmer Schlegel; John Wortman**

**Aberdeen Proving Ground, Ballistic Research Laboratories, 1963, 16 p.**  
**BRL Report No. 1217. AD 425 743.**

**Abstract:** "A mathematical model has been developed for use in conducting cost-effectiveness studies, wherein the objective of the study is to determine alternative families of fire support weapons which will provide a given level of effectiveness for minimum weight and cost."

**Introduction.**

**Statement of the Problem.**

**Dynamic Programming Formulation of the Problem.**

**Discussion.**

Applied Dynamic Programming  
Bellman, Richard E. and Stuart E. Dreyfus

Princeton, Princeton University Press, 1962, 363 p.  
Rand No. R-352-PR.

Summary and Introduction.

- I. One-Dimensional Allocation Processes: introduction; verbal description of the allocation process; construction of a mathematical model; discussion; calculus; difficulties; conclusion; sensitivity analysis; dynamic programming; functional equations; the principle of optimality; a direct derivation; discussion; computational scheme; nonuniqueness of maximum; dynamic programming versus direct enumeration; what difficulties have we overcome; flow chart for general allocation process; numerical results; a useful device; stability; a cargo-loading process; mathematical formulation; discussion; recurrence relations; discussion of computational procedure; reliability of multicomponent devices; reliability via component duplication; a mathematical model; parallel operations; conclusion.
- II. Multidimensional allocation processes: introduction; allocation processes involving two types of resources; recurrence relations; allocation processes two types of constraints; recurrence relations; computational aspects; the flyaway-kite problem; stochastic aspects; dynamic programming approach; computational procedure; the Lagrange multiplier; geometric origin; reduction in dimensionality; equivalence of variational problems; pyramided problems; multidimensional policy space; reliability problem; transportation process; difficult crossing problems.
- III. One Dimensional Smoothing and Scheduling Processes: mathematical formulation; functional equations; the caterer problem; inventory problems.
- IV. Optimal Search Techniques; unimodal function; Fibonacci numbers; golden mean, zeroes of functions; functional equations; defective coin problem; two coin problem.
- V. Dynamic Programming and the Calculus of Variations: isoperimetric problems; necessary, natural boundary, Legerdre; Weierstrass, transversality, Erdmann corner conditions; basic nonlinear partial differential, Euler, and Hamilton-Jacobi equations.
- VI. Optimal Trajectories.
- VII. Multistage Production Processes Utilizing Complexes of Industries.
- VIII. Feedback Control Processes.
- IX. Computational Results for Feedback Control Processes.
- X. Linear Equations and Quadratic Criteria: smoothing problems; deterministic and stochastic cases; adaptive prediction theory.
- XI. Markovian Decision Processes: analytic formulation; computational aspects; solution; simulation technique; connection with linear programming.

5

**XII. Numerical Analysis:** polynomial approximations; orthogonal polynomials, gaussian quadrature; stability; problems; extensions.

**Appendix I.** On a Transcendental Curve (O. Gross): the number of inflection points; a necessary condition for convexity.

**Appendix II.** A New Approach to the Duality Theory of Mathematical Programming (S. Dreyfus and M. Freimer).

**Appendix III.** A Computational Technique Based on Successive Approximations in Policy Space (S. Dreyfus).

**Appendix IV.** On a New Functional Transform in Analysis: the Maximum Transform (R. Bellman and W. Karush).

**Appendix V.** The Rand Johnniac Computer (S. Dreyfus).

**Name Index.**

**Subject Index.**

**An Appreciation of Systems Analysis**  
**Hitch, Charles**

Santa Monica, The Rand Corporation, 1955, Revised, 25 p.  
Rand No. P-699.

A condensation of lectures prepared for Air Force audiences and presented to the Operations Research Society of America at the Los Angeles meeting, 15 August 1955.

**Introduction.**

The Development of Military Systems Analysis: force composition and development decisions; variables; explicit treatment of uncertainty; explicit treatment of uncertainty; explicit treatment of enemy reactions; explicit treatment of time phasing; broadening of criteria.

The Difficulties are in the Problems.

The Positive Side: systems versus nonsystems; analysis versus intuition.

Conclusion.

Army Force Planning Cost Handbook  
Directorate of Cost Analysis

Washington, Department of the Army, 1971, 289 p.

"The purpose of the handbook is to provide type forecast unit building block data and a methodology for force costing."

- I. Explanatory Notes: introduction; assumptions and limitations; glossary.
- II. Basic Planning and Cost Factors: initial investment; annual operating; descriptive data; tables.
- III. Force Unit Summary Costs: division force equivalent summary peacetime costs; force unit summary peacetime costs; SRC composition of divisions.
- IV. Force Unit Building Block Data.

**Aspects of Cost and Utility Analysis in Planning**  
**Bryk, Oliver**

McLean, Research Analysis Corporation (Economics and Costing Division),  
1965, 9 p.

RAC Paper RAC P-8. AD 622 114.

"In this paper, some aspects of planning in preparation for resource-allocation decisions among alternatives, which are generally made under uncertainty, will be discussed from the pragmatic viewpoint of a practicing analyst. No new theory will be expounded. We will be concerned only with that area of economic analysis in which the inputs are not commensurable with the outputs."

Input-Output Relations.

Quantification

Models and Structure.

Discounted and Time-Phased Costs.

Marginal Utility and Cost.

Marginal Substitution.

Background, Development, and Extension of the Revised Simplex  
Method, Orchard-Hays, William

Santa Monica, The Rand Corporation, 1954, 61 p.  
Rand Memorandum RM-1433.

This paper is a short but comprehensive discussion of the development  
of the present form of the simplex method.

Foreward.

- I. Definitions and Convex Sets: introduction; convex cones as intersections of half-spaces; convex cones as the sum of half-lines; polyhedral cones (equivalence of the definitions); further properties and relationships; simplices and optimality problems.
- II. The Simplex Method: prefatory remarks; notation; statement of the linear programming problem; the original simplex method; the development of the simplex method (the revised simplex method, the generalized simplex method, illustrative example, a remark on cycling, the product form of the inverse).
- III. Some Results of Computational Experience: introductory remarks; pre-selecting a feasible or near optimal basis; introducing legitimate unit vectors during construction of a model; introducing some (but not all) artificial unit vectors; synthesizing unit vectors from given activities; generalized use of elementary (row) transformations.
- IV. Parametric Variations and Post-Optimality Problems: parametric variations; the dual problem; altering the right hand side of a system; altering the cost row; changes within the matrix; the complete dualized system.

**A Beginning to Cost-Effectiveness Analysis**  
Vincs, Eugene P.

McLean, Research Analysis Corporation, 1963, 11 p.  
Technical Paper RAC-CP-100. AD 422 374.

**Abstract:** "This short paper describes a method of cost-effectiveness analysis developed to evaluate specific items of Army equipment in mathematical terms as part of the larger problems of optimum allocation of resources. The medium (now "main") battle tank was selected as the leading item on a list of Army equipment chosen for "critically in combat". A linear programming model for the Univac Scientific 1103A computer was set up to solve the problem of maximum combat effectiveness subject to dollar constraints and minimum cost subject to maintaining selected levels of combat effectiveness. Comparative combat effectiveness of US and enemy forces was considered to be the product of ratios of rates of fire, probabilities of hit, and probabilities of kill, given hit. Later, weighting procedures allowed consideration of other factors. The area that gave the greatest difficulty (and that requires the most future research) is that of measures of effectiveness. That difficulty, plus the application of a simplified programming model, qualifies the study's product as illustrative rather than factual."

**Concepts and Procedures of Cost Analysis**  
**Large, J.P.**

Santa Monica, The Rand Corporation, 1963, 402 p.  
Rand Memorandum RM-3589-PR. AD 411 554.

**Summary:** "This Memorandum presents the basic concepts of cost analysis as well as certain specialized procedures for estimating the cost of particular types of equipment. It is intended to be useful both as a primer for persons unfamiliar with cost-analysis and as a handbook for those already in the field. Thus the various chapters differ considerably in their level of generality. One chapter, for example, explains what an estimating relationship is, while the following one presents a step-by-step illustration of the use of statistical regression analysis to derive an estimating relationship. Similarly, primary mission equipment is treated in a general way in one chapter, and then detailed methods for estimating the cost of certain kinds of primary mission equipment (aircraft and missiles) are presented. Other subjects discussed at some length include total force structure cost analysis, the problems of uncertainty, estimating research and development costs of large launch vehicles, and determining personnel requirements."

**Preface.**

**Summary.**

- I. Introduction: system definition; use of dollar costs; time phasing; cost categories; an example; total force structure.
- II. Total Force Structure Cost Analysis (G. H. Fisher): definition; total force structure cost analysis; use of a cost model; relation to individual system.
- III. Cost Analysis of Individual Systems (David Novick & R.L. Petruschell): data requirements (PME and AGE descriptive data, operational and organizational data, manning policy data, in-commission rate data, maintenance concept data, training data); weapon system description - an example; cost categories (R&D, investment, annual operating); investment (installation, equipment, stocks, initial training, miscellaneous); annual operating costs (equipment and installation replacement; maintenance; training; pay and allowances; fuels, lubricants, and propellants; services and miscellaneous); non-direct costs.
- IV. An Introduction to Estimating Relationships (E.L. Petruschell): data accumulation; display forms; benefits of ERs; derivation procedure; example.
- V. Use of Statistical Regression Analysis in Deriving Estimating Relationships (G.H. Fisher): introduction; statement of the problem; a linear normal regression analysis; a curvilinear analysis: logarithmic regression; a curvilinear analysis;

- second degree equation; a multiple regression analysis; appendix A (derivation of the normal equations for a linear normal regression); appendices B, C, D (student problems).
- VI. The Probability of Uncertainty (G.H. Fisher): requirements uncertainty; cost estimating uncertainty; proposals for treatment of uncertainty; use of adjustment factors; the summers magic formula; cost sensitivity analysis.
- VII. Estimating Research and Development Costs of Large Launch Vehicles (J.W. Noah).
- VIII. Estimation of the Requirements for Primary Mission Equipment (R. L. Petruschell): demand for primary mission equipment; time phasing; use of cost-quantity relationships; an example; calculation procedure.
- IX. Aircraft Airframe Cost Estimating Techniques (J.M. Carrier & R.W. Smith): introduction; examples.
- X. Missile Airframe Cost Estimating Techniques (H.G. Campbell).
- XI. Installations (H.F. Harris): estimating methods; example.
- XII. Total System Personnel Estimating (R.L. Petruschell): prerequisite; general procedures; breakdown of jobs; personnel estimating relationships; an example; calculation procedure; personnel data sources.

Concepts and Techniques for Summarizing Defense System Costs  
Noah, J.W.

Washington, Center for Naval Analyses, 49 p.  
SEG RC #1. AD 624 447.

Abstract: "Some techniques used to summarize total costs employed in systems analyses are classified, described, and compared. Their respective advantages and disadvantages are given, and some implications of each are brought out. Five cost-summarizing techniques are selected and distinctions between them are based on common usage. The procedures are termed: five-year system cost, period outlay, net cost, present cost, annual cost. Necessary to their discussion is an understanding of the major types and general content of defense system cost analyses, the concept of remaining value, and the principle that money has time value. A brief section on each of these subjects with appropriate references precedes the discussion of the methods for summarizing costs."

**McClosky, John W.**

Fort Belvoir, US Army Management School (Operations Research/Systems  
Analysis Executive Course), 1967, 29 p.  
AD 661 836.

"In regression the variable which is being predicted is often referred to as the dependent variable, and the variables used in the predicting are referred to as the independent variables. The initial step in an investigation requires that observations be made on both the dependent and independent variables. Using this data a relationship is established which best describes the trend of the observations between the dependent and independent variables to make a reliable prediction as to what the value of the dependent variable would be if observed."

Cost: Analysis and Methodology, Operations Research Series, Volume I.  
A Report Bibliography

Washington, Defense Documentation Center, 1967, 291 p.  
AD 808 900.

"This bibliography was prepared to satisfy recurring requests for searches for cost analysis materials. It represents a comprehensive compilation of unclassified references in the DDC collection that have been catalogued since 1955. References in this collection are concerned with identifying and estimating research and development costs and their associated problems and possible solutions. This broad comprehensive compilation favors cost analysis of systems and yet provides adequate references concerning component, computer programming, and planning costs, along with their associated mathematical concepts and treatments. This is volume 1 of a series, the other parts of which will be as follows:

Vol. III AD 808 901 Cost Effectiveness Analysis

Vol. V AD 808 902 Parametric Identification for Cost Analysis

Cost Analysis for Planning-Programming-Budgeting Cost Benefit Studies  
McCullough, J.D.

Arlington, Institute for Defense Analysis, 1967, 31 p.  
AD 643 472.

Adapted from a paper prepared for the Financial Management and  
Planning-Programming-Budgeting Training Center.

- I. The Role of Cost-Benefit Analysis.
  - II. The Role of Cost in Cost-Benefit Analysis.
  - III. Features of Systems Cost Analysis: end-product orientation;  
extended time horizon; incremental costing; life cycle costs;  
dollars as the measure of resources; analytical approach and  
statistical techniques.
  - IV. Steps of Cost Analysis: defining the problem; obtaining a  
specific systems description; collecting data; converting  
information to a statement of resource requirements; translating  
to costs (catalog price, specific analog, estimating relationship,  
expert opinion; learning curve); presenting cost estimates;  
documenting the analysis.
  - V. Total Program Cost Analysis: inter-systems analysis; intra-systems  
analysis; major program studies; total agency studies (incremental  
costs; total program costs; annual costs; base case; use of  
program and program element; computer model); time phasing.
- Concluding Remarks.
- References.

**Cost Analysis Handbook  
AMC**

Washington, Consultec, 1968, 169 p.  
AD 682 069.

"The purpose of this handbook is to provide guidance and instruction for AMC Cost Analysis personnel who have modest experience with the subject of cost analysis and cost estimating and/or who may be unfamiliar with the operations of the Army Materiel Command. To this end, it provides a definitional framework for cost analysis and cost estimating and a description of the organizational framework within which costs are utilized. It is expected that the users of the handbook will be primarily involved in the Administrative-Decision Making Function within AMC, supplying cost analyses and cost estimates for decisions related to organization, equipment, maintenance, and deployment of Army forces."

**List of Exhibits.**

**Foreward.**

- I. Introduction: purpose and scope; cost analysis and cost estimating; the cost estimating sequence and perspective.
- II. AMC Cost Estimating Framework: administrative-decision making function; resource administration function; AMC organizational function; coding structure interfaces.
- III. Procedures for Cost Analysis: cost information definition acquisition of cost information; validation procedure; consolidating and structuring information; cost analysis; cost estimating relationships; cost analysis documentation and presentation; cost analysis quality control checklist.
- IV. Cost Estimating Techniques: cost estimating relationships; purpose of the estimate; conditioned estimate; translation of estimates into time-phased relationships; validation of cost estimating techniques; specific application of cost estimating in cost analysis.
- V. Cost Estimating Procedure: level of estimate detail; cost estimating schedule; sources of cost information; cost sensitivity analysis; validation of estimate; cost estimate change reports; estimate documentation and presentation; summary report.
- VI. Organizational Implications: cost analysis responsibilities; basic organizational theory; AMC staff interfaces; conclusion relative to the cost analysis function role in AMC.

**Cost Analysis Program**  
**Headquarters, Department of the Army**

Washington, Department of the Army, 1970, 6 p.  
AR 11-18.

This regulation establishes objectives and assigns responsibilities governing Army-wide cost analyses.

- I. Purpose.
- II. References.
- III. Objectives.
- IV. Policy.
- V. Definitions and Functions: cost analysis; cost/benefit analysis; cost information system; economic analysis; force structure cost analysis; incremental cost; life cycle cost analysis; sensitivity analysis; validated cost data; weapon system cost analysis.
- VI. Responsibilities of the Army Staff.
- VII. Responsibilities of Army Commands.
- VIII. Responsibilities of Agencies and Services.
- IX. Coordination Instructions.

**Cost Considerations in Systems Analysis**  
**Fisher, Gene H. (Rand Corporation)**

New York, American Elsevier, 1971, 336 p.  
Rand Report R-490-ASD.

A report prepared for the Office of the Assistant Secretary of Defense (Systems Analysis) on cost analysis aspects of systems analysis. "A text for the teaching of force planning cost analysis . . . as a subset of systems analysis." The main concern: "major resource allocation decisions in the long-range planning context." A listing of supplementary readings follows each chapter.

- I. Introduction.
- II. What is Systems Analysis?: definition; analytical process, models; uncertainty (sensitivity, contingency, & a fortiori analyses); time; validity; qualitative supplements; pitfalls; examples of past applications.
- III. Concepts of Economic Cost: definition; identification, measure, evaluation; past and future; relevant and irrelevant; external and internal; minimizing and maximizing; comparing alternatives; discounting; macro-cost and micro-cost analysis.
- IV. Introduction to Military Cost Analysis: (the output side) major characteristics (emphasis on output-oriented packages of capability; accuracy requirements and possibilities; systematic collection of data and derivation of estimating relationships); fixed budget and fixed effectiveness approaches; examples (intra- and inter-command systems comparisons, force mixes, total force structure cost analysis).
- V. The Input Side: types of input; input structures; examples.
- VI. Estimating Relationships: types (simple linear forms, step functions, multivariate functions); data problem (format, integration, categories, temporal factors, comparability) and approaches (ad hoc sample surveys, experiments, adjustments to raw data base); derivations and uses; examples.
- VII. Cost Models: types (resource requirements submodels, individual system, mission area force mix, total force); examples.
- VIII. Special Topics: treatment of uncertainty (supplemental discounting, adjustment factors, special studies, cost sensitivity analysis); time (military context, undiscounted costs, supplemental discount rate, residual value); wartime costs.
- IX. Systems Analysis Examples.
- X. Summary and Concluding Remarks.
- Appendix A: The Opportunity Cost Concept, an Example from the Microeconomic Theory of the Firm.
- Appendix B: The Concept of Comparative Advantage.
- Appendix C: The Theory of Maximizing Behavior, an Example from the Theory of the Firm.

**Cost-Effectiveness: An Appreciation**  
**Quade, E.S.**

Santa Monica, The Rand Corporation, 1965, 6 p.  
Rand No. P-3248. AD 623 105.

"This paper attempts to clarify the nature and scope of cost-effectiveness analysis and to point out its proper role as an aid to decision-making. It discusses, in the context of national security problems, the reliability and limitations of such analyses and ways to improve its quality."

Introduction.

Definitions.

The Essence of the Method.

The Limitations.

Analysis is Necessarily Incomplete.

Measures of Effectiveness are Approximate.

No Satisfactory Way to Forecast the Future Exists.

The Virtues.

The Future.

Concluding Remarks.

Bibliography.

Graph; the Structure of Analysis.

**Cost-Effectiveness: Estimating Systems Costs**  
**McCullough, J.D.**

Bethesda, The Rand Corporation, 1965, 26 p.  
Rand No. P-3229. AD 622 023.

The objective is "to discuss the significant features and general procedures involved in systems analysis, directed particularly to the users of cost estimates - either study directors who must direct a team of systems analysts and cost analysts, or systems analysts who must work with cost analysts."

Introduction.

Features of Cost Analysis: end-product orientation; extended time horizon; incremental costing; life cycle costs; dollars as a measure of resources; the analytical approach and the use of statistical techniques.

Steps of Cost Analysis: defining the problem; collecting data; deriving the estimate; presenting the estimate; documenting the analysis.

Concluding Remarks.

Bibliography.

**Cost-Effectiveness: Some Trends in Analysis**  
Quade, E.S.

Santa Monica, The Rand Corporation, 1967, 18 p.  
Rand No. P-3529. AD 650-129.

New approaches to cost-effectiveness analysis are being proposed constantly. Most are primarily mathematical in nature, but a few are "directed toward a better treatment of those aspects of its problems that cannot be handled by purely quantitative methods." This paper notes three trends involving, respectively: computers, mathematics, and the direct use of expertise. The last is described in some detail, especially the Delphi technique and its extensions.

Cost-Effectiveness Analysis: New Approaches in Decision-Making  
Goldman, Thomas A., Editor

New York, Frederick A. Praeger, 1967, 231 p.

A collection of essays sponsored by the Washington Operations Council and one of the series in the Praeger Studies in US Economic and Social Development. The papers included are those given at a symposium in Washington.

- I. Introduction and Overview (Edward S. Quade): definitions; the essence of the method; the virtues; the limitations; the present; the future; notes.
- II. Measures of Effectiveness (William A. Niskanen): choosing measures of effectiveness; the relation of defense objectives to national objectives; defense objectives by area and level of conflict; measures of effectiveness for defense objectives; notes.
- III. The Choice of Analytic Techniques (Alfred Blumstein): kinds of models; relationship of models to defense systems; uses of the model; considerations in model selection.
- IV. The Use of Cost Estimates (Harry P. Harry): types of cost-effectiveness analysis; the basic input data; future system cost estimating (CERs); treatment of cost uncertainty; problems of cost analyst-system analyst coordination; documentation; the choice of the cost measure; selected bibliography.
- V. Estimating Systems Costs (James D. McCullough): features of cost analysis; steps of cost analysis; selected bibliography.
- VI. Armed Forces' Use of Cost-Effectiveness Analysis (LTC R.S. Berg): the operational requirement; technical trade-offs; system costs; analysis of design characteristics; intersystem comparisons.
- VII. Defense Contractor Use of Cost-Effectiveness Analysis (Eugene R. Brussell).
- VIII. An Analysis of Tactical Air Systems (Murray Kamrass and Joseph A. Navarro).
- IX. Cost-Effectiveness Analysis for Government Domestic Programs (William M. Capron).
- X. Cost-Effectiveness Analysis for the "War on Poverty" (Stanley M. Benen, Alan E. Fechter, and Anthony C. Fisher).
- XI. An Analysis of Metropolitan Transportation Systems (John F. Kalu).

Cost Estimates as Predictors of Actual Weapon Costs: A Study of Major  
Hardware Articles  
Summers, Robert

Santa Monica, The Rand Corporation, 1965, 72 p.  
Rand Memorandum RM-3061-PR (Abridged). AD 612 723.

Summary: "This is a statistical study of military cost estimates aimed at decreasing the uncertainties about their interpretation and use. Based on a sample of 68 cost estimates of major hardware articles in 22 systems, it assesses their accuracy as predictors of actual cost. Section 1 describes the aims and scope of the study and presents a detailed summary of methods and results. Section 2 presents the statistical analysis of estimating errors, and Section 3 shows quantitatively that the observed errors can significantly affect the choice between alternative systems."

Preface.

Summary.

- I. Introduction: aims and scope of the study; outline of methods and results.
- II. An Analysis of Cost-Estimate Chronologies: errors in nonmilitary cost-estimating; model of the development process; preliminary description of the data; raw measure of accuracy of estimates; adjusted measure of accuracy of estimates; model of the development process; bivariate analysis of  $t$  and  $A$ ; the variables; regression results; hypothesis testing; data problems (errors in measurement, randomness); estimation of independent variables; conclusions about learning during development; cost changes of major article components; the "changing-configuration" hypothesis; conscious underbidding of contractors.
- III. The Consequences of Cost-Estimate Inaccuracies: cost inaccuracies versus other uncertainties; system choice and inaccurate cost estimates: bias; variance; implications for cost-effectiveness studies; implications for force-structure projections.

Appendix. Examination of Three Cost-Effectiveness Studies.

Cost Factoring System for Force Readiness Projection (COFACTS)  
Wilbourn, C.R.; R.M. Burbridge; D. Cohen; K.L. Lehmann; M.L.  
Patterson; J.D.H. Sidley.

Washington, Planning Research Corporation, 1968, 180 p.  
PRC R-1145. AD 860 253.

Abstract: "This report describes the analyses and development of the Cost Factoring System for Force Readiness Projection (COFACTS). Three mathematical models were developed: a force readiness measurement model, which has the unique feature of utilizing cost as a criterion of readiness capability; a budget model, which computes force related costs by budget program; and a cost impact model which calculates cost implications of increasing or decreasing force readiness levels. The computer system, which incorporates these models, the resultant reports, and their applications to the various levels of the force planning process are also presented."

Summary: introduction; system applications; measurement of projected force readiness; budget model; cost impact of readiness changes; COFACTS computer system; conclusions and recommendations.

- I. Introduction: the problem; status of the problem's solution; background orientation; the COFACTS system; beyond COFACTS; organization of the report.
- II. Systems Application: introduction; the COFACTS resource readiness summary; the COFACTS force budget outputs; cost impact outputs; annex outputs.
- III. Measurement of Projected Force Readiness: general; major assumptions; general methodology systems flow; selection of readiness measurement categories; general readiness cost ratios; individual subcategory cost factor development; aggregate readiness level determination.
- IV. Budget Model: recurring costs; replacement training; initial costs; the reserve/national guard model.
- V. Cost Impact of Readiness Changes: introduction; methodology.
- VI. COFACTS Computer System: general; the preprocessor; SACS; PAMSIM; P20A/224T; the COFFIN file; the model; implementation procedure; current implementation status.
- VII. Conclusions and Recommendations.
- Appendix A. Example of Total Cost Implication of a PEMA Budget Cut.
- Appendix B. Cost Models.
- Appendix C. Glossary.
- Appendix D. Previous Studies of Army Force and Force/Budget Readiness.

**Cost-Quantity Calculator**  
Noah, J.W. and R.W. Smith

Santa Monica, The Rand Corporation, 1962, 27 p.  
Rand Memorandum RM-2786. AD 279 346.

Summary: "The Cost-Quantity Calculator at the back of the book is designed to provide cost analysts with a tool for construction and interpretation of those cost-quantity relationships usually referred to as learning, progress, or improvement curves. The two most common of these curves are treated here: the Log-linear cumulative average curve and the log-linear individual unit curve. A definition of these curves is given in the text, along with an explanation of their differences and interactions. For practical application of these relationships, tables of slope-quantity factors are provided."

Costing Methodology Handbook  
Directorate of Cost Analysis, Comptroller of the Army

Washington, Department of the Army, 1971, 179 p.  
AD 884 835L.

Published (in conjunction with a revised AR 37-18) in response to a need expressed in the Weapon System Acquisition Improvement Program to provide a vehicle for developing a standard cost methodology. Objectives: (a) to provide a better understanding of the cost estimating/analysis process, (b) to promote standardization in cost analyses, (c) to contribute to a better cost analysis capability in the Army, consistent with the objectives of the Army Cost Analysis Program (Cf. AR 11-18). Part 1: the process of cost estimating (chapters 1-7); Part 2: other considerations (chapters 8-10).

- I. The Life Cycle and Decision Points: concept formulation; contract definition; development and production; operations and disposal.
  - II. Preliminary Guidance.
  - III. System Description and Information Search: Five Year Defense Program; Army Materiel Plan; Army Force Planning Cost Handbook; selected acquisition reports; contractor reports and financial records; Weapon System Cost Data Handbook; Development Concept Paper; Area Coordination Paper; Materiel Need; prior studies.
  - IV. Techniques of Costing: parametric cost estimating (cost/parameter relationships, scatter diagrams, regression models, least-squares estimating, measuring errors, correlation analyses, other regression techniques, learning curves); estimating by analogy; industrial engineering approach; expert judgment; program stretchouts.
  - V. Measures of Estimate Validity: uncertainty and risk (techniques, examples); sensitivity analysis.
  - VI. Economic Considerations: economic analyses; time-phasing; inflation; constant dollars; current year dollars; present value; annex 1 (general instructions for inclusion of price escalation in certain cost estimates for research and development, procurement, and construction); annex 2 (instructions for calculations of price escalation in the selected acquisition report).
  - VII. Presentation of the Estimate: general format and instructions for use; US Army Management School Operations Research/Systems Analysis Executive Course - Check List, Briefing Techniques.
  - VIII. Cost Growth: definition, categories.
  - IX. Cost Effectiveness.
  - X. A New Technique to Analyze R&D Estimates: STECPLLOT: problem, technique, explanation, example, qualifications and extensions.
- Appendix A. Modeling and Simulation: types (iconic, analog, symbolic); principle types of cost models; design and use of weapon system cost model.
- Appendix B. References.
- Appendix C. Glossary.

Costs and Benefits in Mathematical Programming  
Manne, A.S.

Santa Monica, The Rand Corporation, 1956, 14 p.  
Rand Memorandum RM-1785.

Summary: "In cooperation with members of the US Military Air Transport Service (MATS), the author recently engaged in an attempt to determine whether MATS airlift planning could be improved by the substitution of linear programming methods for trial-and-error rule-of-thumb methods. The experiment, described in some detail in the paper, was not successful, for the following reasons. The gains were not spectacular, being on the order of two or three percent in terms of the potential increase in useful airlift from the existing resources, and on the order of one day in fourteen in terms of reduction of the length of the planning cycle. The costs promised to be rather high, because to realize the potential gains it would be necessary to have a guarantee of immediate access at unpredictable times to an expensive electronic computing machine. Above all, the lack of mathematical training among the middle management group makes it far easier for an organization such as MATS to accommodate itself to trial-and-error methods rather than to linear programming models."

- I. Introduction.

**Costs of Operation and Maintenance Activities (Army): Techniques for  
Analysis and Estimation**  
Phillips, John G.

McLean, Research Analysis Corporation, 1967, 77 p.  
Technical Paper RAC-TP-242. AD 811 500.

The research in this paper develops "a method for determining the cost impact of proposed force changes on the operation and maintenance, Army (OMA) appropriation activities. A study of the Army's financial accounting system structure and budget data has been made to form a method that will determine those OMA activities that depend on force changes. For these activities illustrative cost-estimating relations (CERs) are developed."

**Foreward.**

**Summary:** Problem; facts; discussion; conclusions.

**Curves: a Five-Function Curve-Fitting Computer Program**  
Boren, H.E.

Santa Monica, The Rand Corporation, 1968, 83 p.  
Rand Memorandum RM-5762-PR. AD 680-762.

**Summary:** "This Memorandum describes a FORTRAN-IV curve-fitting computer program that has been developed within the Rand Cost Analysis Department. The program makes least-squares determinations of the parameters of any of five mathematical functions selected by the user, given a set of observations on the dependent and independent variables of interest. The functions available in the program are the line, parabola, power, asymptotic-power, and exponential. Up to three independent variables may be used for the line and power functions. Also, the Y-intercept may be specified for the line, parabola, or asymptotic-power function. A discussion of the characteristics of the functions is presented in Section I, including an examination of those nonlinear functions that require special methods for solution. Also included is a brief discussion of the statistics used in the program. Specific details on the operation of the program are presented in Section II. This section also treats the options available to the user. Program outputs are discussed in Section III. For the benefit of the reader, sample outputs from two runs are shown."

**Decision Analysis: Introductory Lectures on Choices Under Uncertainty**  
**Raiffa, Howard**

Reading, Addison-Wesley, 1970, 310 p.

This approach prescribes how an individual who is faced with a problem of choice under uncertainty should go about choosing a course of action that is consistent with his personal basic judgments and preferences.

**Introduction.**

- I. Your Basic Problem: statement; variations.
- II. Analysis of Your Basic Problem: data; expected monetary value; analysis of the no-experiment alternatives; the decision flow diagram; probability assessments at chance forks; averaging out and folding back; expected value of perfect information and opportunity loss.
- III. Uncertain Payoff and Biased Measurements: sampling costs; value of information.
- IV. Utility Theory: use of CMEs in analysis; lotteries; substitutability; the indifference function for money; transitivity; the maximization of expected utility; decreasing risk aversion; risk control.
- V. Use of Judgmental Probability: objective vagueness; calibration of subjective vagueness; a consistency property for judgmental probability; the additivity of judgmental P\*-measure; the analysis of the eo-branch; the reduction of a general lottery; the revision of judgmental probabilities.
- VI. The Normal Form of Analysis: strategies; randomized strategies; choice; modification of a nonEMV'er; indifference curve analysis; the principle of substitution for strategies; choice of weights.
- VII. More on the Economics of Sampling.
- VIII. Risk Sharing and Group Decisions.
- IX. The Art of Implementation and General Critique: the multi-attribute problem; assessments of several uncertain quantities.
- X. Further Perspectives and a Guide to the Literature.

**Index.**

**The Data of Your Basic Problem.**

**Decisionmaking Among Multiple-Attribute Alternatives: a Survey and Consolidated Approach**  
MacCrimmon, K.R.

Santa Monica, The Rand Corporation, 1968, 63 p.  
Rand Memorandum RM-4823-ARPA. AD 681 005.

Summary: "Various methods have been proposed to help the decision-maker with multiple-attribute decisionmaking. These range from techniques which consider all attributes at once to those which consider just single attributes, or proceed sequentially over single attributes. This memorandum critically reviews the assumptions underlying each approach and examines its information requirements. In addition, each method is described both in a general way and using a formal, abstract mathematical representation. Two examples, the choice of a weapon system and of a space suit, are used to illustrate the discussion."

**Preface.**

**Summary.**

- I. Introduction: the decisionmaking process (goals, complexity, choosing among alternatives with many attributes); scope and organization of the memorandum.
- II. Multiple-Attribute Decisions: attributes, goals, criteria, and dimensions; a military systems example; symbolic representation.
- III. Existing Approaches to Multiple-Attribute Decisionmaking: full dimensionality (dominance, satisfying); single dimensionality (maximin, maximax, lexicography, additive weighting, effectiveness index, utility theory); intermediate dimensionality (trade-offs, non-metric scaling, summary of procedures).
- IV. Extensions and Combinations of Procedures for Multiple-Attribute Decision-Making: uncertainty in attribute values; a subsystems example; eclectic approaches to the multiple-attribute problem (combinations of approaches, current uses of multiple-attribute methods).

**Bibliography.**

**Decision-Making for Defense**  
**Hitch, Charles J.**

Berkley, University of California, 1965, 83 p.

"The first series of Garther lectures. The first lectures trace the evolution of the defense problem; the second describes the purpose and function of the 'programming' system installed in 1961. The third describes the efforts to apply the techniques of operations research or systems analysis to the problem of defense decision-making, particularly with regard to the choice of weapon systems and the allocation of resources among alternative forces and programs. The final lecture attempts to evaluate these innovations, to discuss the unresolved problems in their application, and to assess their place in the future."

- I. 1789-1960
  - II. Planning-Programming-Budgeting
  - III. Cost-Effectiveness
  - IV. Retrospect and Prospect
- Notes.

**Defense Management**  
**Enke, Stephen**

Englewood Cliffs, Prentice-Hall, 1967, 385 p.

This book appraises and describes various aspects of cost-benefit analysis of the kind now widely practiced within the Department of Defense. Part 1: Pentagon decision making (chapters 1-5); Part 2: cost effectiveness applications (chapters 6-14); Part 3: special defense problems (chapters 15-20).

- I. The Defense Resource Allocation Process (William A. Niskanen).
- II. The Annual Cycle: Planning-Programming-Budgeting (Robert N. Grosse and Arnold Proshan).
- III. Costing of Systems (Norman V. Breckner and Joseph W. Noah).
- IV. Remaining Difficulties in Program Budgeting (Roland N. McKean).
- V. Cost Effectiveness of Cost Effectiveness (Armen A. Alchian).
- VI. The Changing Environment for Systems Analysis (James R. Schlesinger).
- VII. Central War Alternatives (R.H. McMahan, Jr. and D.H. Taylor).
- VIII. New Perspective in Civil Defense (Herman Kahn and Anthony J. Weiner).
- IX. Mobility-Airlift, Sealift, and Prepositioning (Richard B. Rainey, Jr.).
- X. Maintenance (John J. McCall).
- XI. Procurement and Management of Spares (Harrison S. Campbell).
- XII. Incentive Contracts (Frederick T. Moore).
- XIII. Land Utilization for Defense (Jora R. Minasian).
- XIV. Military Manpower Utilization (Harry J. Gilman).
- XV. Research and Development (T.K. Glennan, Jr.).
- XVI. Defense Impacts on International Payments (Rolf Piekars).
- XVII. Defense Expenditures and the Domestic Economy (Murray L. Weidenbaum).
- XVIII. Defense Decentralization Through Internal Prices (Martin J. Bailey).
- XIX. NATO Defense Planning: the Political and Bureaucratic Constraints (A.W. Marshall).
- XX. Military Assistance Programs (Charles Wolf, Jr.).

**Defense Planning and Organization**  
**Enthoven, Alain and Henry Rowen**

Santa Monica, The Rand Corporation, 1959, 78 p.  
Rand No. P-1640.

This is an exploratory essay on the organization of the Department of Defense, written expressly for an audience of professional economists (and using, therefore, the technical language of formal economic theory). The paper covers three topics: (1) the shortcomings of the present organization, (2) the general question of intelligibility of defense allocation problems, and (3) some implications of the principles discussed and a few practical suggestions.

**Prefatory Note.**

- I. Introduction.
- II. The Defense Economy: some views on defense allocation; conflict over budget level and the efficiency of allocation; budget structure; organization structure and decentralization; the lack of permanent staff.
- III. Some Theoretical Aspects of Defense Organization: Which criteria? Whose criteria?; the multiplicity of criteria; interactions; the significance of game aspects; the power and limits of analysis.
- IV. Some Suggestions for Improving Defense Organization: the role of the Secretary of Defense; budgeting for missions and weapon systems; decentralization through the use of budgets and prices; the defense reorganization of 1958.

Footnotes.

**Definitions of Expenses and Investment Costs**  
**Office of the Assistant Secretary of Defense (Comptroller)**

Washington, Department of Defense, 1966, 10 p.  
DODI 7040.5.

This instruction sets forth criteria and definitions to be used in (a) specifying the financial contents of the program elements in the Five Year Defense Program, (b) defining the financial contents of those accounts that make up the Defense budget, and (c) defining the financial contents of the accounts that comprise the Department of Defense management accounting system.

- I. Purpose.
- II. Applicability.
- III. Basic Distinction Between Expenses and Investment Costs.
- IV. Expenses.
- V. Investment Costs.
- VI. Conditional Cases.
- VII. Implementation and Effective Date.
- Enclosure 1. Investment Cost Decision Diagram.
- Enclosure 2. Special Guidance Concerning Real Property.

**Derivation of Estimating Relationships: an Illustrative Example**  
**Fisher, G.H.**

Santa Monica, The Rand Corporation, 1962, 83 p.  
Rand Memorandum, RM-3366-PR.

This memorandum was prepared for a course in military systems cost analysis concepts and techniques, offered by the Air Force Systems Command. It presents illustrative examples of how statistical regression analysis may be used to derive estimating relationships from historical data. Examples of simple linear regression, logarithmic linear regression, second degree regression, and multiple linear regression analyses are presented and discussed.

Preface.

Summary.

I. Introduction.

II. Statement of the Problem.

III. Linear Normal Regression Analysis of Initial Tooling Cost as a Function of Airframe Weight.

IV. A Curvilinear Analysis: Logarithmic Regression.

V. A Curvilinear Analysis: Second Degree Equation.

VI. A Multiple Regression Analysis.

Appendix A. Derivation of the Normal Equations for a Linear Normal Regression.

Appendix B. Student Problem in Simple Linear Regression Analysis.

Appendix C. Student Problem in Curvilinear Regression Analysis.

Appendix D. Student Problem in Multiple Regression Analysis.

**The Development and Application of a Procedure for Estimating the  
Economic Life of Weapons Systems**  
Eastman, Samuel Ever and William K. Scheirer

Washington, Department of the Army (Directorate of Cost Analysis,  
Comptroller of the Army), 1970, 38 p. AD 711 115.

"The research work herein was undertaken to assist in the implementation of Army Regulation No. 37-13, 'Financial Administration, Economic Analysis of Proposed Army Investments.' . . . The approach to the development and application of a procedure for estimating the economic life of weapons systems has been threefold. Our first task was to determine what was good practice in determining economic life of weapons systems. This was done by reviewing the literature, reports, and data available. The second task was to develop a procedure for estimating economic life of weapons systems. This was done by developing a cost minimization model. The third task was to apply the procedure to estimate the economic life of some of Army equipment using a single engine.

- I. Summary and conclusions.
- II. Introduction.
- III. Determination of Useful Life by the US Treasury. Applicability to military weapons systems; the economic life of military weapons systems determined from technical change.
- IV. Definitions of Economic Life from Economic Theory.
- V. Applications of the Cost Minimization (with Replacement).
- Technical Appendix: Cost Minimization Model; Parts Cost Functions and Odometer Settings; Expected Depot Overhaul Costs.
- References.

**Development Cost Estimating Survey  
Task 3**

Cambridge, Management Systems Corporation, 1963, 124 p.  
AD 408 987.

This report documents a survey of development cost estimating techniques and sources of pertinent data on past weapon systems. It catalogues and codifies most of the valuable information on this subject and outlines the sources of appropriate historical data. In addition, the survey provides a basis for defining the analytical and data collection program to follow.

- I. Summary: objectives, results.
- II. Conclusions and Recommendations.
- III. Discussion: general; historical data sources; cost-estimating techniques; cost estimating relationships; approach to future data analysis.
- Appendix 1. Bibliography.
- Appendix 2. Selected Report Abstracts.
- Appendix 3. Sources Contacted, Sept. 27 to Dec. 14, 1962.
- Appendix 4. Summary of Cost Estimating Relationships.
- Appendix 5. Data Collection Formats.
- Appendix 6. Task Statement.

**Differential Games: A Mathematical Theory with Applications to Warfare and Pursuit, Control and Optimization**  
Isaacs, Rufus

New York, John Wiley and Sons, 1965, 384 p.

"This work covers the nature and scope of differential games, discrete models, formal mathematical mold, and detailed explanations of the solutions. The primary emphasis is on military applications."

- I. An Introduction: the theory of games; the state and control variables; battle games; games with moving craft; pursuit games; games of kind and games of degree; strategies; dogfights, firing games, programming, and athletics; a perspective on precision; a perspective on progress.
- II. Definitions, Formulation, and Assumptions: the kinematic situation; the realistic and reduced space; termination of the game; the payoff; games of kind and games of degree; strategies; canonization on circular vectograms; a lemma on circular vectograms.
- III. Discrete Differential Games: the general discrete game; battles of extinction; quasi-discrete games.
- IV. The Basic Mathematics and the Solution Technique in the Small: the nature of a solution; the main equation; semipermeable surfaces and a second derivation of the main equation; the verification theorem; the path equations; the retrogression principle; the initial conditions.
- V. Examples.
- VI. Efferent or Dispersal Surfaces: singular surfaces; dispersal surfaces; the question of the perpetuated dilemma; the geometric method for simple pursuit games of kind; the existence of the perpetuated dilemma.
- VII. Afferent or Universal Surfaces: with null integrals, with linear vectograms; the analytic necessary condition for a linear vectogram type universal service; the workable condition when  $n=3$ ; the calculus of variations viewpoint; all strategies optimal; the workable criterion when  $n=4$ ; a test for a void; test for a transition surface; relation to Euler equation; restoration of the totality of control variables; semiuniversal surfaces.
- VIII. Games of Kind: the barrier concept; the construction of semipermeable surfaces; termination of barriers; construction of the barrier; fusion of games of kind and degree.
- IX. Examples of Games of Kind.
- X. Equivocal Surfaces and the Homicidal Chauffeur Game: geometric solution; primary solution; the universal curve and its tributaries; equivocal surfaces; appendix.
- XI. The application to Warfare: game theory and war; the available techniques; types of applications; problems of formulation; some pitfalls.

XII. Toward a Theory with Incomplete Information: search games with immobile hiders; with mobile hiders; the importance of approximations; the chancifying method; appendices.

**The Discount Rate in the Non-Market Context**  
**Franks, Francis John**

Monterey, Naval Postgraduate School, 1968, 47 p.  
AD 832 903.

**Abstract:** "Systems Analysis uses many disciplines and sophisticated techniques to determine the relative effectiveness of alternate systems. This relationship can then be reversed by an arbitrary choice of a discount rate. In the private sector, the discount rate is determined by the cost of capital. In the public sector, the cost of acquiring the capital is not clearly defined. The following proposals for the interest rate in the public sector are considered: (1) the government bond rate; (2) the rate of growth of the national product; and (3) a rate derived from the average rate of return in the private sector. It is concluded that the interest rate in the private sector lies between 4.75 and 10 percent. The circumstances which generate uncertainty and the means of handling this uncertainty are also discussed. A procedure is recommended which modifies the difference between expected costs to make them equally significant. Particular attention is focused on uncertainty occasioned by changing technology and the probability of war. It is concluded that a unique estimate of the risk component is indeterminate and that uncertainty should be considered in the context of the specific systems under consideration."

**I. Introduction.**

**II. Opportunity Costs:** the interest rate; the bond rate; growth rate of the national product; the rate of return in the private sector.

**III. Uncertainty:** factors generating uncertainty; means of handling uncertainty; statistical analysis.

**IV. Summary.**

**Discount Rates and Procedures to be Used in Evaluating Deferred Costs  
and Benefits  
Bureau of the Budget**

Washington, Executive Office of the President, 1969, 7 p.  
BOB Circular A-94.

This circular prescribes standard discount rates and procedures to be used in evaluating the measurable cost, benefits, or outputs of programs or projects when these costs, benefits, or outputs occur over time and when they can be estimated.

- I. Purpose.
- II. Scope.
- III. Agency Coverage.
- IV. Preparation and Presentation: expected yearly cost; expected yearly benefit; expected yearly output; discount rate; discount factor; present value cost; present value benefit; present value output; present value net benefit; benefit-cost ratio; output-cost ratio; internal rate of return.
- V. Discount Rate Policy.
- VI. Uncertainty and Risk.
- VII. Interpretation.
- VIII. Effective Date.
- Attachment A. Sample Format for Discounting Deferred Costs and Benefits.
- Attachment B. Discount Factors.

**Discounting in Military Cost-Effectiveness Studies**  
**Stone, Donald R.**

Monterey, Naval Postgraduate School, 1965, 42 p.  
AD 475 334.

Thesis abstract: "Discounting is a means of assigning different weights to costs expected to be incurred in different future time periods. Such costs are a vital element of cost-effectiveness studies, which under present DOD policy provide the primary basis for military procurement and force structure decision making. The discounting process is reviewed, and an attempt is made to identify qualitatively the factors which should determine the discount rate to be used by DOD cost-effectiveness studies. These factors are separated into two groups: those which apply to cost-effectiveness studies of all types of weapons systems, and those which depend upon the type of system being considered. Finally the manner of presenting the results of the discounting process to the decision maker is discussed."

- I. Introduction.
- II. Cost-Effectiveness Studies.
- III. The Discounting Process.
- IV. The Normative Component.
- V. The Risk Component.
- VI. Presentation of Results.

"Discounting in Systems Cost Analysis"  
Cowie, John

Washington, DC, Office of the Assistant Secretary of Defense (SA)  
Economics, 19 September 1967, 15 p.

"The purpose of this paper is to specify the costs which are relevant in the comparison of defense systems; in particular, it will be stressed that if cost streams which are spread over time are to be compared, some sort of discounting procedure must be used."

Introduction.

The Costs of Defense.

Systems Costs and Discounting.

Discounting in Business Decisions.

Discounting Defense Expenditures.

Present Values and Future Values.

The Significance of Discounting.

**Dynamic Programming**  
**Bellman, Richard**

Princeton, Princeton University Press, 1956, 342 p., Rand No. R-295.

"The purpose of this work is to provide an introduction to the mathematical theory of multi-stage decision processes." Bibliographies follow each chapter.

**Preface.**

- I. A Multi-Stage Allocation Process: functional equation approach; a multi-dimensional maximization problem; a smoothing problem; infinite stage approximation; existence and uniqueness theorems; approximation in policy space; convexity, concavity; time-dependent processes; multi-activity processes; multi-dimensional structure theorems; continuity and memory; stochastic allocation processes; functional equations; Stieltjes integrals.
  - II. A Stochastic Multi-Stage Decision Process: stochastic gold mining; enumerative treatment; infinite stage approximation; existence and uniqueness; a finite number of stages; a three-choice problem; a stability theorem.
  - III. The Structure of Dynamic Programming Processes: the principle of optimality; discrete deterministic, stochastic, and continuous deterministic processes; causality and optimality; approximation in policy space.
  - IV. Existence and Uniqueness Theorems: equations of type one, two, and three; monotone convergence; stability theorems; an optimal inventory equation.
  - V. The Optimal Inventory Equation.
  - VI. Bottleneck Problems in Multi-Stage Production Processes.
  - VII. Bottleneck Problems: Examples.
  - VIII. A Continuous Stochastic Decision Process; continuous versions; derivation of the differential equations; the variational procedure; solution for finite total time; mixed policies; solution for infinite time; nonlinear utility.
  - IX. A New Formalism in the Calculus of Variations.
  - X. Multi-Stage Games: single-stage discrete game; min-max theory; continuous games; finite resources; games of survival; pursuit games; a basic lemma; existence and uniqueness; proof of results; non-zero-sum games.
  - XI. Markovian Decision Processes: a lemma; existence and uniqueness; Riccati equation; approximation in policy space; discrete versions; recurrence relation; min-max; generalization of a VonNeumann result.
- Index of Applications.

**Dynamic Programming and the Calculus of Variations**  
**Dreyfus, Stuart E.**

Santa Monica, The Rand Corporation, 1965, 511 p.  
Rand No. R-441-PR. AD 468 205 and AD 470 877.

**Abstract:** "A demonstration of the relationships between the calculus of variations, a mathematical discipline concerning certain problems of optimization theory, and dynamic programming, a newer mathematical approach to optimization problems. In addition to explaining and contrasting the two approaches, the report shows that many results of the calculus of variations become simple and intuitively apparent when examined from the dynamic programming viewpoint. In emphasizing the geometrical and physical insight afforded by this approach, the study shows how these techniques can be applied, for instance to stochastic and adaptive variational problems. It can be used in the study of dynamic programming and other new mathematical formalisms; in optimal control problems, such as the determination of rocket trajectories, the correction of launch errors and inflight disturbances of spacecraft; and in the problems of optimal control found in economics, biology, and the social sciences."

**Preface.**

**Summary.**

**Economic Analysis  
Working Paper**

Norfolk, Armed Forces Staff College, 1971, 523 p.

This draft volume is a working paper and is being developed as a first source reference in support of Department of Defense Instruction 7041.3. The additional references and bibliography are not included in the draft, but will be included in the final hard copy.

- I. Economic Analysis: definitions; discussion; techniques; DODI 7041.3; article from Armed Forces Management.
- II. Accounting, Financial Management: roles of financial executive; primary functions; secondary functions; organizational processes; managerial accounting; analysis of funds; budgeting; financial management in government and business; the profit motive.
- III. Analog Method of Cost Estimation.
- IV. Benefit-Cost Analysis: problem; background; tradeoffs.
- V. Correlation Analysis.
- VI. Cost-Effectiveness Analysis: definitions; background; marginal utility of weapon systems; contributions by analysts.
- VII. Cost-Estimating Relations.
- VIII. Critical Path Method: military planning; wide application; basic procedures; compress schedule; complicating elements.
- IX. Delphi Method.
- X. Engineering Method of Cost Estimation.
- XI. Discounting: planning capital acquisitions; general framework of analysis; estimating the variables; other methods; reference problems.
- XII. Gaming.
- XIII. Linear Programming: preliminary remarks; graphical solution; linear programming.
- XIV. Marginal Analysis: theory of production and marginal products; demands for factors (derived, interdependent); the production function; marginal products (defined, as solution to distribution); maximizing profit; graphical depiction; law of diminishing marginal physical product; least cost.
- XV. Modeling: nature; design and use; types; evaluation; advantages.
- XVI. Monte Carlo Techniques.
- XVII. Operations Research: origin; basic concepts; methods; future; examples.
- XVIII. PERT: principles and applications; techniques.
- XIX. Probability Theory.
- XX. Quantitative Analysis: systems approach; scientific method; uncertainty; objectives; alternatives; costs; models; criteria; readings.
- XXI. Queuing.

- XXII. Regression Analysis.
- XXIII. Sensitivity Analysis.
- XXIV. Simulat'on.
- XXV. Statistical Inference.
- XXVI. Systems Analysis: background; principles and procedures.
- XXVII. Productivity Accounting.

**Economic Analysis and Military Resource Allocation**  
Smith, T. Arthur, ed.

Washington, Department of the Army (Office, Comptroller of the Army),  
1968, 182 p., AD 841 253.

"This volume considers the decision process in the Department of Defense and its impact on Army plans. The role of Army plans is then addressed in terms of the economic decisions that must be made and the form and types of economic analysis used to support these decisions. Where methodology is developed, general models are described and their implications discussed. This is the case in the development of resource impact models for use in force planning and the development of resource projects for hardware systems. In other instances, such as logistics areas, maintenance and reliability considerations, and the broader aspects of life cycle costing, model development has not reached that general state. In these cases, the discussion centers on the impact of policy on resource acquisition and utilization and available methodological techniques. In all instances, the cost side of the cost-effectiveness equation is stressed. This emphasis is a reflection of the primary intent of the series, the improvement of training and the development of communications within the cost analysis community."

Introduction (T. Arthur Smith).

Economic Analysis and Military Resource Allocation (T. Arthur Smith).

Economic Analysis of the Army Logistics System (Rex Brugh).

Peacetime and Wartime Costs in Cost Effectiveness Analysis (John McClelland).

Army Force Cost Models - An Example (T. Arthur Smith).

Whither Life-Cycle Cost? (Arnold F. Klick).

A Method for Relating Combat Vehicle Operating and Maintenance Costs to Reliability and Maintainability Goals (R.J. Byer, C.F. Blozan, W.T. Towles).

Management and the Systems Analysis Mystique (Paul L. Peck, Jr.).

Cost Estimations for Conceptual Systems (David O. Gochran).

Vehicle Cost Model (John L. Hamilton).

Cost Analysis Methodology for T53 and T55 Turbine Engines (John L. Hamilton & James T. Wormley).

**Economic Analysis for Engineering and Managerial Decision-Making**  
Barish, Norman N.

New York, McGraw-Hill, 1962, 729 p.

"This book is directed to persons who are concerned with economic analyses and aims to present the basic reasoning and methodology of various disciplines which are important in decision-making. It is designed to be practical rather than theoretical. It is technique-oriented. Mathematical symbolism is kept as simple as possible and derivations or proofs are presented only if they are simple and will illustrate the subject matter." Part 1: engineering and business decision-making (chapters 1,2); Part 2: costs (chapters 3-8); Part 3: methods for tangible evaluation of alternatives (chapters 9-12); Part 4: capital management (chapters 13-17); Part 5: determinations of minimum cost and maximum profit (chapters 18, 19); Part 6: risk, uncertainty, and intangibles (chapters 20-27); Part 7: elements of economic measurement, analysis, and forecasting (chapters 28-35).

- I. Introduction.
- II. Objectives and Criteria for Engineering and Business Decisions.
- III. The Cost of Operating an Enterprise.
- IV. Cost Concepts for Decision-Making.
- V. Interest and Time Value of Money.
- VI. Depreciation.
- VII. Profits, Interest, and Return on Investments.
- VIII. Income Taxes.
- IX. Annual-Cost Comparisons.
- X. Present-Worth and Premium-Worth Comparisons.
- XI. Determination of Rate of Return.
- XII. Determinations of Equal Cost and Payout.
- XIII. Capital Investment and Theory of Planning.
- XIV. The Enterprise's Assets and Sources of Funds.
- XV. Sources of Future Capital Funds.
- XVI. Capital Planning and Budgeting.
- XVII. The Economy of Replacement and Retirement (Economic Life).
- XVIII. Minimum-Cost Functional Relationships.
- XIX. Programming for Minimum Cost of Maximum Profit.
- XX. Risk, Uncertainty, and Intangibles.
- XXI. Descriptive Statistics, Probability, and Expected Costs.
- XXII. Probability Distributions.
- XXIII. Sampling and Confidence Limits.
- XXIV. Model Building and Simulation.
- XXV. Simulating Risk (Monte Carlo Technique).
- XXVI. Waiting-time (Queuing) Evaluations.
- XXVII. Evaluating Intangibles.
- XXVIII. Economics of the Firm.
- XXIX. Measures of Economic Activity.
- XXX. Time-series Analyses.
- XXXI. Regression and Correlation Analysis.

- XXXII. Econometric Models, Demand Analysis, and Sales Forecasting.  
XXXIII. Short-run Cost Relationships.  
XXIV. Break-even Analysis for Profit Planning.  
XXXV. Long-run Cost Variations (Scale of Operations).

Appendix:

Tables:  $\frac{1}{4}$ % interest factors; 1% interest factors; 2% interest factors; 3% interest factors; 4% interest factors; 5% interest factors; 6% interest factors; 8% interest factors; 10% interest factors; 12% interest factors; 15% interest factors; 20% interest factors; 25% interest factors; 30% interest factors; 40% interest factors; 50% interest factors; uniform-gradient conversion factors (values of factors to convert a uniform gradient,  $g$ , to an equivalent uniform payment,  $R$ ); areas under the normal curve; student's  $t$  distribution; random digits; random normal numbers (Gaussian deviates).

Charts: single-payment compound-amount factors for various interest rates from  $\frac{1}{4}$ % to 50%; single-payment present-worth factors for various interest rates from  $\frac{1}{4}$ % to 50%; uniform-series compound-amount factors for various interest rates from  $\frac{1}{4}$ % to 50%; sinking-fund payment factors for various interest rates from  $\frac{1}{4}$ % to 50%; capital-recovery factors for various interest rates from  $\frac{1}{4}$ % to 50%; uniform-series present-worth factors for various interest rates from  $\frac{1}{4}$ % to 50%; curves for determining probability of observing  $d$  or less Poisson occurrences in a sample selected from a population having an average of  $c$  occurrences per unit of space or time.

Selected Bibliography.

**Economic Analysis of the Integrated Facilities System (IFS)**  
Noah, Joseph W.; Robert P. Caldarone; Carl R. Wilbourn

Washington, Planning Research Corporation, 1969, 101 p.  
PRC R-1209, Volume IX, AD 872 133L.

**Summary:** "The economic analysis of the IFS addresses the total resource requirements and benefits associated with the development, implementation, and operation of a CONUS-wide system. The study results provide information to assess the impact of IFS on Army resources, and to indicate the magnitude of benefits that will accrue to the Army from IFS. The economic analysis should be viewed as a tentative effort."

- I. Introduction: purpose; summary; report organization.
- II. Methodology: cost-benefit analysis; limitations.
- III. Development of Resource Implications of IFS: functional resource implications; ADP resource implications; total costs.
- IV. Potential Benefits: general; benefits measured; benefits not measured.
- V. Cost-Benefit Comparison: general; conclusions.

**Economic Analysis of Proposed Army Investments**  
**Headquarters, Department of the Army**

Washington, Department of the Army, 1969, 23 p.  
AR 37-13.

- I. General Policies for Proposed Investments: general (purpose, scope and applicability, explanation of terms, objectives, policies, responsibilities, references); concepts (time period covered by an economic analysis, present value, discount rate, uncertainty, adjustment for inflationary trends).
  - II. Investment Proposals for Weapon Systems and Research Projects: general; application to weapon system; application to research projects; exceptions.
  - III. Administrative Instructions: general; preparation of Format A; preparation of Format A-1; Preparation of Format B.
- Appendix. Definition of Terms.

**Economic Analysis of Proposed AWC Investments and Other Resource  
Management Programs  
Headquarters, Army Weapons Command**

Washington, Army Weapons Command, 1970, 11 p.  
AWCR 11-20.

This regulation implements AR 37-13 and AMCR 11-34 and prescribes supplemental policy, responsibilities, and procedures to be employed in applying economic analysis to the US Army Weapons Command decision process.

- I. Purpose.
- II. Scope.
- III. General.
- IV. Objectives.
- V. Policy.
- VI. Responsibilities.
- VII. Procedures.
- VIII. References.

**Economic Analysis of Proposed Department of Defense Investments  
Headquarters, Department of the Air Force**

Washington, Department of the Air Force, 1969, 44 p.  
AFR 172-2.

This regulation is applicable to all commands and separate operating agencies. It implements the attached DOD Instruction 7041.3 and requires the preparation and evaluation of economic analyses on proposed Air Force investments meeting certain criteria. It encourages the submission of an economic analysis when it has significant impact on budget justification. It prescribes the necessary policy, procedures and assignment of responsibilities necessary for the evaluation of economic aspects of proposed investments.

- I. Background.
- II. Purposes.
- III. Applicability and Scope.
- IV. Explanation of Terms.
- V. Policy on the Use of Economic Analysis in Investment Decisions.
- VI. Procedures for Preparing and Submitting Economic Analyses.
- VII. Responsibilities of HQ USAF Directorate of Budget.
- VIII. Other HQ USAF Office Responsibilities.
- IX. Command Operating Agency Responsibilities.
- Attachment 1. References and Related Directives.
- Attachment 2. DOD Instruction 7041.3, 26 February 1969, and Change 1, 26 March 1969.

**Economic Analysis of Proposed Department of Defense Investments  
Office of the Assistant Secretary of Defense (Comptroller)**

Washington, Department of Defense, 1969, 40 p.  
DODI 7041.3.

This instruction establishes policy and procedures for consistent application of economic analysis to proposed Department of Defense investment projects.

- I. Purpose and Objectives.
  - II. Policy.
  - III. Applicability and Scope.
  - IV. Definitions.
  - V. Procedures: general (equal benefits, equal cost, both unequal); time periods covered; present value; discount rate; uncertainty; adjustments for inflation; criteria for recommending and selecting investments; preparation and submission of investment proposals.
  - VI. Effective Date and Implementation.
- Enclosure 1. References.
- Enclosure 2. Definitions.
- Enclosure 3. Instructions for Preparing Formats A, A-1, and B - Summary of Project Costs and Benefits: general; format A; format A-1; format B; project year discount factors.
- Enclosure 4. Techniques of Economic Analysis: general; use of the present value (discounting) technique.

**Economic Analysis of Proposed Department of the Navy Investments  
Office of the Secretary of the Navy**

Washington, Department of the Navy, 1970, 40 p.  
SECNAVINST 7000.14.

This instruction implements DCD Instruction on Economic Analysis of Proposed MOD Investments, and establishes policy and procedure for consistent application of economic analysis.

**Economic Analysis of Public Investment Decisions: Interest Rate  
Policy and Discounting Analysis  
Subcommittee on Economy in Government**

Washington, US Congress (Joint Economic Committee), 1968, 25 p.

**Abstract:** "In this report, the Subcommittee on Economy in Government presents its conclusions on the application of discounting procedures in Federal Government bureaus and agencies and submits its recommendations on this matter. The subcommittee accepts without qualification the proposition that consistent discounting procedures and appropriate interest rate policy must be adopted throughout the Federal Government if wise and economic investments are to be made. Testimony presented to the subcommittee demonstrated that such consistency is not now present. The subcommittee recommends that no public investment be deemed "economic" or "efficient" if it fails to yield overall benefits which are at least as great as those which the same resources would have produced if left in the private sector. This report deals with the optimum discounting procedures to be used in evaluating the economics of public investments."

- I. Interest Rate Policy and Discounting Analysis - An Abstract.
  - II. The Planning-Programming-Budgeting System is the Means for More Efficient Government Decisions.
  - III. The Discounting Procedure Must be Used if Good Public Investment Decisions are to be Made.
  - IV. Current Discounting Practices in the Federal Agencies are Neither Adequate nor Consistent.
  - V. The Appropriate Interest Rate Concept is the Opportunity Cost of Displaced Private Spending.
  - VI. The Current Risk-Free Interest Rate which should be Used for Evaluating Public Investments is at least 5 percent.
  - VII. All Federal Agencies should Establish Consistent and Appropriate Discounting Procedures Utilizing an Appropriate Base Interest Rate Computed and Published on a Continuing Basis.
- Appendix. The SST and the Interest Rate: An example of the role of discounting.
- Separate Views of Representative Patman.
- Separate Views of Senator Sparkman.
- Supplementary Views of Senators Symington, Jordan, and Percy.

**Economic Aspects of Military Procurement and Supply  
Subcommittee on Defense Procurement**

Washington, US Congress (Joint Economic Committee), 1960, 125 p.

A report by the subcommittee appointed to conduct a study of the impact of defense procurement and disposal policies on the economy. This study follows the subcommittee hearings on "The Impact of Defense Procurement" which were held January 28-30, 1960.

Letter of Transmittal.

Conclusions and Recommendations: general; scope of activities; quality of operation; attempts at progress; GAO findings; recommendations.

Economic Aspects of Military Procurement and Supply: introduction; general summary.

I. Scope and Economic Impact of Military Supply and Related Functions.

II. Quality of Military Supply Management: studies and reports.

III. Congressional Efforts for Improvement: management (top management agencies); supply management; supply management in DOD.

IV. Reorganizing the supply and service functions in the Army.

Appendix 1. Quotations from previous Joint Economic Committee Reports re-effect of military procurement on the economy.

Appendix 10. General Eisenhower on defense policy affecting supply management.

Appendix 11. Congressional Correspondence on integrated supply.

Appendix 12. Strengthening of National Security Act.

Appendix 13. Correspondence on unified contract audit.

Appendix 14. Correspondence on integration of electronics supply and communications.

**Economic/Cost Benefit Analysis of Proposed AMC Investments**  
**Headquarters, Army Materiel Command**

Washington, Army Materiel Command, 1970, 15 p.  
AMCR 11-34.

This regulation prescribes policy and procedures to be employed in applying the fundamental concepts of economic/cost benefit analysis to the AMC decision process.

- I. Purpose.
  - II. Scope.
  - III. Objectives.
  - IV. Policy.
  - V. Responsibilities.
  - VI. Procedures.
  - VII. Economic Analysis in the Decision Process.
  - VIII. Major Concepts and Techniques: resource impact; scope of coverage; evaluating investment alternatives; role in management process; present day value; economic life; uncertainty; adjustments for inflationary trends; documentation; cost estimating.
  - IX. References.
- Appendix. Techniques Used in Economic Analyses. Formats. Project Year Discount Factors.

**Economic Forecasting**  
**Stakler, Herman O.**

New York, Praeger Publishers, 1970, 182 p.

The studies in this book present techniques and empirical results which are relevant either for evaluating or for improving quantitative economic forecasts.

- I. Quantitative Economic Forecasts: Judgmental and Econometric Methods.
- II. Forecasting with Econometric Models.
- III. Evaluation of Econometric Inventory Forecasts.
- IV. An Evaluation of Quarterly Judgmental Economic Forecasting.
- V. Econometric vs. Judgmental Forecasting.

The Economics of Defense in the Nuclear Age  
Hitch, Charles J. and Roland N. McKean

Santa Monica, The Rand Corporation, 1960, 424 p.  
Rand No. R-346. AD 243 098.

"Economics is concerned with allocating resources - choosing doctrines, equipment, techniques, and so on - so as to get the most out of available resources. Economizing means trying to make the most efficient use of the resources available. A major purpose of this report is to show the usefulness of this way of looking at military problems. We consider the economic problems of defense at each of three rather gross levels: the quantity of national resources available, now and in the future; the proportion of these resources allocated to national security purposes; and the efficiency with which the resources so allocated are used by the defense departments." Part 1: the resources available for defense (chapters 3-6); Part 2: efficiency in using defense resources (chapters 7-12); Part 3: special problems and applications (chapters 13-18).

- I. Defense as an Economic Problem (introduction).
- II. The Background: Defense against What? (introduction).
- III. Resource Limitations: specific versus general constraints; role of GNP.
- IV. Diverting GNP to Defense: How Big a Defense Budget?: budgetary process; program versus object; program size; military personnel.
- V. Indirect Effects of Defense Spending.
- VI. The Economic Strengths of the Major Powers: problems of international comparison; GNP; defense budgets.
- VII. Efficiency in Military Decisions: optimal, efficient, and feasible positions; one input, two outputs; two inputs, one output; economic analysis; the requirements approach; the priorities approach.
- VIII. An Illustrative Application of Economic Analysis: problem; mission; alternatives; costs; criterion; models and procedure; results and conclusions. Appendix on the models and the computations: cost coefficients; aggregation of channels; optimizing procedures.
- IX. The Criterion Problem.
- X. Incommensurables, Uncertainty, and the Enemy.
- XI. Problems Associated with Time.
- XII. Institutional Arrangements to Promote Efficiency.
- XIII. Military Research and Development.
- XIV. Logistics.
- XV. The Economics of Military Alliance.
- XVI. Economic Warfare and Disarmament.
- XVII. Mobilization, Civil Defense, and Recuperation.
- XVIII. Choosing Policies for Deterrence.
- Appendix: The Simple Mathematics of Maximization: introduction;

constrained maxima; economic efficiency; nonlinear programming;  
the gradient method.

**Efficiency and Economy in Government Through New Budgeting and  
Accounting Procedures**  
Novick, David

Santa Monica, The Rand Corporation, 1954, 122 p.  
Rand No. R-254.

"A proposal for a new method of budgeting and accounting for the military, including in the financial process a constant attention to cost considerations, cost comparisons, and analysis thereof."

- I. Introduction.
- II. The Role of Budgeting and Accounting: budget functions; accounting functions; budgeting, accounting, and operations; present federal budget and proposal; present federal accounting and proposal.
- III. Cost Considerations in Weapons Systems Analysis.
- IV. Rand's Cost Analysis Method: major elements of operation; accumulating total cost; the distinction between investment and annual operating expenditures; present application; comparison of the two methods; possibilities of general application; general operational considerations.
- V. Detailed Description of Rand Methodology: investment cost categories; annual operating cost categories.
- VI. Outline of Accounting System Proposed for the US Air Force.
- Appendix 1. Brief History of the Federal Budget.
- Appendix 2. Coding Structure for Cost Analysis of the US Air Force.
- Appendix 3. Sample Worksheet Forms.

**Efficiency in Government through Systems Analysis. With Emphasis on  
Water Resources Development.  
McKean, Roland N. (The Rand Corporation)**

New York, John Wiley & Sons, 1958, 336 p.

"The inquiry deals specifically with the comparison of water-resource projects, but the comparison of alternative operations or policies of other sorts involves many of the same problems, and the broader purpose of the study is to assist in the general struggle for economy, in the improvement of analysis in government, and in the extension of its use. Part 1: introduction (chapter 1); Part 2: some general problems of analysis (chapters 2-6); Part 3: special problems in the analysis of water-resource projects (chapters 7-10); Part 4: the problems as illustrated by specific analyses (chapters 11, 12); Part 5: other potential uses of analysis to increase governmental efficiency (chapters 13, 14).

- I. Setting, Scope, and Plan of the Study.
  - II. The Criterion Problem: criteria; proximate criteria; sub-optimization; common errors; appropriate criteria.
  - III. The Appropriate Alternatives: relevant context; relevant courses; interrelationships.
  - IV. Intangibles, Uncertainty, and Criteria.
  - V. Time Streams and Criteria: time horizon; measured in dollars; in physical units.
  - VI. What Can Be Done: a Recapitulation.
  - VII. Criteria in the Selection of Water-Resource Projects.
  - VIII. Kinds of Benefit and Cost: Spillover Effects; technological; pecuniary; consistency; ranking of projects.
  - IX. Kinds of Benefit: Over-counting, and Secondary Benefits: double-counting; secondary benefits; treatment of taxes.
  - X. Valuation of Benefits.
  - XI. Case Study 1: The Green River Watershed.
  - XII. Case Study 2: Santa Maria Project.
  - XIII. Analytic for Performance Budgets: An Illustration.
  - XIV. Analytical Aids to Governmental Economy: A Survey of Opportunities.
- Appendix on Possible Classifications of Expenditures by Program, and Indicators of Performance.
- Bibliography.
- Published Rand Research.

**Elementary Statistical Analysis**  
**Wilks, Samuel Stanley**

Princeton, Princeton University Press, 1948, 284 p.

- I. Introduction.
  - II. Frequency Distributions: for ungrouped and grouped measurements; cumulative polygons graphed on probability paper.
  - III. Sample Mean and Standard Deviation: for ungrouped and grouped measurement; simplified computation.
  - IV. Elementary Probability: in simple repeated trials; permutations; combinations; calculation; mathematical expectation; geometric probability.
  - V. Probability Distributions: discrete; continuous; mathematical manipulation.
  - VI. The Binomial Distribution: derivation; the mean and standard deviation.
  - VII. The Poisson Distribution: derivation; mean and variance; fitting to a sample distribution.
  - VIII. The Normal Distribution. general properties; applications.
  - IX. Elements of Sampling: from a finite and an infinite population; theoretical sampling distributions of sums and differences of sample means.
  - X. Confidence Limits of Population Parameters.
  - XI. Statistical Significance Tests.
  - XII. Testing Randomness in Samples: runs; quality control charts.
  - XIII. Analysis of Pairs of Measurements: method of least squares; simplified computation of coefficients for regression line; generality of the method.
- Index.

**Elements of Defense Economics**  
**Hitch, Charles J. and Roland N. McKean**

Washington, Industrial College of the Armed Forces, 1967, 167 p.

The purpose of this text is to introduce the student to some of the essential elements of economic analysis which have come to play a vital part in Defense management since 1961. Part 1: analytical and factual background (chapters 1, 2); Part 2: the resources available for defense (chapters 3, 4); Part 3: efficiency in using defense resources (Chapters 5-8).

- I. Defense as an Economic Problem.
  - II. Defense Against What?
  - III. Resource Limitations.
  - IV. Diverting GNP to Defense: How Big a Defense Budget?
  - V. Efficiency in Military Decisions: three general approaches; optimal, efficient, and feasible positions; one input, two outputs; two inputs, one output; the elements of an economic analysis; the requirements approach; the priorities approach; some misunderstandings; efficiency in the large versus efficiency in the small; kinds of military decisions.
  - VI. The Criterion Problem: criteria; some criterion errors; appropriate criteria.
  - VII. Incommensurables, Uncertainty, and the Enemy.
  - VIII. Problems Associated with Time; why discount; what rate; what value for future inputs and outputs; some practical dodges; undervaluing future outputs.
- Concluding Observations.  
Index.

**Empirical Cost Estimates for Military Construction and Price Adjustment Factors**  
**Headquarters, Department of the Army**

Washington, Department of the Army, 1969, 13 p.  
AR 415-17.

This regulation provides empirical cost estimates for permanent military construction, area price adjustment factors, and unit cost adjustment chart.

- I. Purpose.
- II. General.
- III. Explanation of Tables and Unit Cost Adjustment Chart.

**Estimating Cost Uncertainty Using Monte Carlo Techniques**  
**Dienemann, Paul F.**

Santa Monica, The Rand Corporation, 1966, 49 p.  
Rand Memorandum RM-4854-PR. AD 629 082.

**Summary:** "Suggested in this Memorandum is a technique for expressing cost estimates of future systems as probability distributions to reflect the uncertainty of the estimate. The impact of this information is shown to be relevant to the decision-making process. For the purpose of the study, the relationship between the sources of uncertainty and system cost estimates is depicted as an input-output model. Within this framework, a procedure was developed to estimate probability distribution for each of the input uncertainties. From the input distributions, a Monte Carlo procedure is used to generate a series of system cost estimates. A frequency distribution and common statistical measures are then prepared from the set of output estimates to ascertain the nature and magnitude of the system cost uncertainty. To illustrate the proposed technique, a case study involving the cost estimate of a hypothetical aircraft system with air-to-surface missiles is presented."

**Preface.**

**Summary.**

- I. Introduction: sources of uncertainty; relevance to decision-making; expressing cost uncertainty.
  - II. Monte Carlo Techniques for Estimating Uncertainty: simulating probability distributions; estimating system cost uncertainty.
  - III. Case Study: Individual Weapon System Cost Analysis: input probability distributions; Monte Carlo simulation of system cost uncertainty; case 1 (cost-estimating uncertainty); case 2 (total uncertainty); conclusions.
  - IV. The Greater Problem: Uncertainty in Cost/Effectiveness Studies.
- Appendix A. Weapon System Cost Model Inputs.  
Appendix B. Weapon System Cost Model Outputs.  
Appendix C. FORTRAN Subroutines for Estimating Uncertainty.

An Extended Concept of Model  
Quade, E.S.

Santa Monica, The Rand Corporation, 1970, 13 p.  
Rand No. P-4427. AD 710 639.

A slightly abbreviated version of this paper will appear in the Proceedings of the 5th International O.R. Conference. "The function of a model in operations research is to 'predict and compare'; to provide a logical way to forecast the outcomes that follow alternative actions and, hopefully, to indicate a preference among them. A mathematical formulation with which one can optimize is an extremely valuable aid to this process. But it is not crucial; there are other routes. What is crucial to every decision process is reliance on expert judgment and intuition. This reliance permeates every aspect of operations -- in deciding what approach is likely to be more fruitful, in designing the model, in determining what the facts are, and in interpreting the results. One great virtue of model building is that it provides a systematic, explicit, and efficient way to focus the required judgment and intuition.

A model, by introducing a precise framework and terminology, serves as an effective means of communication, enabling analysts and various experts to exercise their intuition and judgment in a well-defined context and in relation to each other. In addition, it provides feedback to guide the participants in the revision of their earlier judgments. It is these features of the model that are essential to its role in supplying a route from hypotheses to prediction, not how explicitly it represents the real world or whether or not it provides a formal or quantitative scheme for optimization.

"The author's contention is that "there are advantages in using approaches that sacrifice representation also. This suggests taking a broad view, accepting as a model any device that provides a logical means to predict and compare the outcomes of alternative actions, regardless of its representative features or how efficient it is at optimization. Calling such a device a 'model' in the context of operations research would help to counter the bias toward mathematical models acquired by so many analysts through their education and work with industry."

There follows a discussion of one such device, the Delphi procedure.

**The Feasibility of Deriving a Cost/Effectiveness Formula for Man/  
Machine Function Allocation**  
Connelly, Marilee N.

San Diego, US Naval Personnel Research Activity, 1966, 75 p.  
Research Memorandum SRM 67-4. AD 639 674.

**Abstract:** "This report presents a summary of progress made in a continuing investigation into the feasibility of deriving a cost/effectiveness formula for man/machine function allocation. A preliminary cost/effectiveness formula is presented with an evaluation of the sources and availability of the data inputs required by the formula. Using a preliminary formula and methodology as a basis for the analysis, it was concluded that adequate measures of cost are available but that adequate measures of variable effectiveness have not yet been developed. Due to complexity of the cost/effectiveness formula and to the lack of accessibility of input data, a large amount of time and money will be required to perform function allocation analyses. It was determined that the derivation of a cost/effectiveness formula for man/machine function allocation is feasible. At this time, cost/effectiveness analysis seems applicable to most cases of function allocation and appears to offer a reliable method for the allocation of functions between man and machine."

**Brief.**

- I. Introduction: cost/effectiveness; purpose; scope of report; research approach; background (function allocation, the concept of using cost/effectiveness for function allocation).
- II. Procedure: cost (equipment, personnel, utilizing the cost formula); effectiveness.
- III. Conclusions and Recommendations.

**A Generalized Cost Model For Military Systems**  
**Eliel, L. Frank**

El Segundo, Aerospace Corporation, 1965, 8 p.  
Report No. TOR-469(5530 (1))-3. AD 484 388.

**Abstract:** "The rapid development of complex schemes for estimating the costs of military systems has obscured the fundamental requisite structure of systems cost models. In this paper, some of the major relationships are restated symbolically to describe the major features of these models and to permit a more logical development of the general problem. The primary interfaces between system costing and the other related design, planning, and analysis activities are discussed with reference to the requirements which these latter activities place upon the cost model."

- I. Introduction.
- II. General Economic Models and Definitions.
- III. The Basic Estimating Technique.
- IV. Cost as a Function of Quantity.
- V. Synthesizing the System.
- VI. Financial Planning.
- VII. Economic Planning and Resource Constraints.

**Government Decision-Making and the Theory of Choice  
Smithies, A.**

Santa Monica, The Rand Corporation, 1964, 11 p.  
Rand No. P-2960. AD 607 584.

Discussion of the decision-making processes in government and the importance of recognising that this process must be designed both to determine the objective function and to achieve an efficient allocation. The central purpose of this paper is "to demonstrate the fundamental role of choice among alternative courses of action in government decision-making. The process of choice not only points to the most efficient way to attain given objectives, but is basic to the determination of the objectives themselves. Decision-making thus involves not merely determining how given objectives can be attained at minimum costs, but also exploration of the variety of ways in which resources can be effectively employed. Recognition of the latter aspect of decision-making has evoked a new set of concepts such as program budgeting, cost effectiveness, and systems analysis. This paper attempts to examine the nature of decision-making in terms of standard economic theory, and hopefully, to throw light on the implications of the new vocabulary."

**Guide for Reviewers of Studies Containing Cost-Effectiveness Analysis**  
Heymont, I.; O. Bryk; H. Linstone; J. Surmeir

McLean, Research Analysis Corporation (Economics and Costing  
Department), 1966, 67 p.

"To assist in the review of studies containing cost-effectiveness analyses, a series of questions with explanatory notes have been prepared. These questions, taken together, will not necessarily cover all aspects of all cost-effectiveness analyses. No one general list of questions can do that. Rather, the questions are designed to focus the attention of the reviewer on selected aspects to assist him in evaluating the analysis. All the questions are not applicable to all studies and they are not necessarily of equal importance to those studies where they do apply . . . This document is intended only as a guide and not as a full and comprehensive treatment of all aspects of cost-effectiveness analysis."

**Foreward.**

- I. General Background: introduction; cost-effectiveness analysis and the estimate of the situation; essential elements; the objective; alternatives; cost; models; criteria; role of judgment; review of studies.
- II. Key Questions: statement of the problem; assumptions; alternatives; documentation and data; cost; relationships (models); equal effectiveness methods; effectiveness; criteria; cost-effectiveness curves; conclusions and recommendations.

AMCP 706-191, entitled: "Engineering Design Handbook -  
Systems Analysis and Cost-Effectiveness", April 1971.

**Guidelines for the Presentation of Army Cost Analyses**  
**Resource Management Corporation**

Bethesda, RMC, 1970, 58 p.  
RMC Draft Report UR-125.

Prepared for the Comptroller of the Army, the body of the report "is addressed to the formation of guidelines for presentation of Army cost analyses. The organization of the report is in the form of three questions: To whom and for what reason are cost analyses presented? What analysis should support Army cost presentations? and What is to be presented? . . . The scope of the present effort is limited to future weapon/support systems only. Additionally, the study is limited only to those types of decisions made by the Chief of Staff, which do not necessarily correspond with the same decisions as the Office of the Secretary of Defense."

- I. Introduction.
- II. The Organizational and Decision Context of Army Cost Analysis:  
current Army management of individual weapon/support systems;  
senior officer materiel review board; selected acquisition reports;  
aggregate management of Army Materiel; analysis of current practices.
- III. Elements of an Army Cost Analysis Procedure; weapon/support cost analysis cost tracking procedures; review of weapon/support systems cost estimates submitted to COA/DA; system review; what are the assumptions used in the analysis; force specification; materiel and personnel specification; cost evaluation and cost estimating tools; cost estimates; force structure analysis; sensitivity and uncertainty analysis.
- IV. Presentation Formats.

**Guidelines in Accumulating Financial Data on Future Weapons**  
**Pardee, F.S.**

Santa Monica, The Rand Corporation, 1960, 46 p.  
Rand Memorandum RM-2583-ARPA. AD 418 652.

**Summary:** "Weapon system evaluation involves systematic and critical examination of alternative means of performing specified military tasks of missions. In this analytical process it is necessary not only to measure technical and operational capability, but also to obtain a reasonable estimate of total financial requirements and the variations from case to case. This paper attempts to provide guidance in collecting the financial data necessary to the evaluation."

- I. Background: place of cost in the over-all evaluation process; the financial data cycle; cost concepts; the uncertainty issue.
- II. Description: prime hardware; development and operational concept; program phasing; potential bottlenecks - state-of-the-art and resource shortages.
- III. Requirements for Financial Data: definitions; form 1 - contractor and/or arsenal development, production, and support (development, production, support, industrial facilities); form 2 - cradle-to-grave cost (research and development, initial investment, operation, example of sensitivity analysis).

**How Much is Enough? Shaping the Defense Program, 1961-1969**  
Enthoven, Alain C. and K. Wayne Smith

New York, Harper & Row, 1971, 364 p.

"This book was written for three main purposes. The first is to record some of the valuable lessons regarding strategy, force, and financial planning learned in the 1950's and 1960's and applied in the 1960's in the hope that by doing so, they will not have to be relearned in the 1970's. The second is to make a case for what we believe to be the proper role of the Secretary of Defense: that is, personally to grasp the strategic issues and provide active leadership in developing a defense program that sensibly relates US foreign policy, military strategy, defense budgets, and the choice of major weapons and forces. The third is to increase public understanding of the uses of analysis in defense decision making and to help build support for its increased use."

**Information for Decision Making: Quantitative and Behavioral Dimensions** Rapoport, Alfred, Editor

Englewood Cliffs, Prentice-Hall, 1970, 447 p.

The book is addressed to the informational aspects of management systems. The primary objective is to relate advances in information technology, quantitative methods, and the behavioral sciences, to the task of effectively designing and using decision-oriented information systems. Part 1: background and approach (chapters 1, 2); Part 2: information for planning and control (chapters 3-8); Part 3: behavioral aspects of information (chapters 9, 10).

- I. A Setting for Information and Decisions: the structure of management decision theory; accounting for decision making; management misinformation systems; basic concepts for designing a fundamental information system.
- II. Development and Use of Models: on the art of modeling; computer simulation - a solution technique for management problems; heuristic models - mapping the maze for management.
- III. Basic Framework for Planning and Control: framework for analysis; longrange planning - challenge to management science; a program of research in business planning.
- IV. Coping with Uncertainty of Relevant Planning and Control Variables: forecasting consideration in design of management information systems; multiple regression analysis of cost behavior; sensitivity analysis in decision making.
- V. Integrated Planning and Control Models - Selected Applications: simulation in financial planning; a linear programming model for budgeting and financial planning; an accounting system structure on a linear programming model.
- VI. Information for Production and Marketing Decisions: cost-volume profit analysis under conditions of uncertainty; PERT/Cost - the challenge; a design for the firm's marketing nerve center.
- VII. Information for Evaluation of Risky Capital Investments: uncertainty and its effect on capital investment analysis; a review of same; stochastic decision trees for the analysis of investment decisions; limit DCF in capital budgeting.
- VIII. Decentralized Financial Control Systems; return on investment - the relation of book yield to true yield; new system for divisional control; accounting implications of a mathematical programming approach to the transfer price problem.
- IX. Motivational Information Systems.
- X. Impact of Information on Decision Making.

**An Introduction to Cost-Effectiveness Analysis**  
**Grosse, Robert N.**

McLean, Research Analysis Corporation, 1965, 27 p.  
RAG Paper RAG-P-5. AD 622 112.

This paper is designed to show the basic theory underlying cost-effectiveness analysis and to be a beginning for developing the tools and language that would permit greater ease in use and understanding of cost-effectiveness analysis.

An Introduction to Equipment Cost Estimating  
Batchelder, C.A.; H.E. Boren; H.G. Campbell; J.A. Dei Rossi; J.P. Large

Santa Monica (California), The Rand Corporation, 1969, 121 p.  
Rand Memorandum RM-6103-SA. AD 702 424

Prepared for the Office of the Assistant Secretary of Defense (Systems Analysis) and dealing with the fundamentals of cost analysis. This memorandum constitutes the introductory portion of a book on the subject of military cost-estimating procedures. Bibliographies on pp. 77 and 121.

- I. Cost-Estimating Methods: industrial engineering, analogy, statistical approaches.
- II. Data Collection and Adjustment: collection (historical, resource, physical and performance characteristics, program); adjustment (definitional differences, physical and performance considerations, non-recurring and recurring costs, price-level changes, cost quantity adjustments, other possible cost adjustments).
- III. Statistical Methods in Development of Estimating Relationships: simple linear regression (least-squares estimating, statistical inference, prediction intervals); curvilinear analysis; multiple regression analysis; documentation.
- IV. Use of Cost-Estimating Relationships: characteristics, hardware considerations, judgment.
- V. The Learning Curve: the log-linear hypothesis (unit curve, cumulative average curve); nonlinear hypothesis; plotting a curve; variations; applications.

**An Introduction to Equipment Cost Estimating (Note 1)**  
**Large, J.P.**

Santa Monica, The Rand Corporation, 1968, 139 p.  
Rand Memorandum RM-5470-SA. AD 664 825.

Summary: "This memorandum discusses the fundamental problem of estimating major equipment costs and suggests that for many purposes, particularly for government cost analysis, a statistical approach is the most suitable. The kind of data required and the adjustments needed to make the data useful are discussed in some detail. The use of regression analysis in deriving cost-estimating relationships is described, but it is emphasized that unquestioning use of estimating relationships obtained in this manner can result in serious errors. The concepts underlying the cost-quantity relationship generally known as the learning curve are presented along with instructions for its use. Finally, the problem of uncertainty in cost estimating is discussed and a few suggestions for dealing with the problem are included."

Preface.

Summary.

- I. Cost-Estimating Methods.
- II. Data Collection and Adjustment.
- III. Using Statistics in the Development of Estimating Relationships: curvilinear analysis (logarithmic regression, second-degree equation); multiple regression analysis; documentation; bibliography.
- IV. Using Estimating Relationships: understanding the estimating relationship; understanding the hardware; judgment.
- V. The Learning Curve: the linear hypothesis; nonlinear hypotheses; plotting a curve; variations; applications; bibliography; appendix.
- VI. Uncertainty: proposals for treatment of uncertainty.

Introduction to Probability and Statistical Decision Theory  
Hadley, George

San Francisco, Holden-Day, 1967, 580 p.

This work is intended as a modern introduction to probability and statistical decision theory for those with no previous training in these areas. The Bayesian approach to decision theory, based on the use of prior probabilities and utilities, is emphasized.

- I. Foundations of Probability Theory: statistical decision theory; mathematical models; probability and relative frequencies; probability and the degree of rational belief; set theory; the event set; the basic probability model; evaluation of the probabilities of the simple events; the case of equally likely simple events; some simple results; random variables; expected value of a random variable; distribution of a random variable; the summation notation; functions of a random variable; variance of a random variable.
- II. The Theory of Utility: projects; decision rules; introduction to uncertainty; single stage, two stage, and n-stage lotteries; the model of rational behavior; use of expected monetary values.
- III. Single Stage and Sequential Decision Problems, and Their Solution.
- IV. Single-Stage Decision Problems: the normal form; the general single stage inventory problem; incremental analysis; the scrap allowance problem; the expected cost of uncertainty; opportunity loss; periodic review inventory systems; probabilities not known; mixed strategies; geometric interpretation; Bayes' strategy.
- V. Additional Developments of Probability Theory: decomposable experiments; product models; independence; combinatorial analysis; the binomial distribution; the Poisson distribution; the Pascal distribution; sampling and hypergeometric distribution.
- VI. Conditional Probability Models and Joint Distributions: Bayes' law; linear combinations of random variables.
- VII. Continuous Random Variables: the normal distribution; treatment; use of calculus; normal distributions; gamma distributions; joint and conditional density functions; geometric probability problems; linear combinations of random variables; the central limit theorem; simulation.
- VIII. Use of Experiments in Decision Problems.
- IX. Connection with Classical Statistics: hypotheses testing; estimation; errors of selection or measurement.
- X. The Poisson Process: stochastic processes; the Poisson process; as a recurrent event process.
- XI. Sequential Decision Problems: the backward solution; multistage inventory problems.

**An Introduction to Systems Analysis**  
**Hoag, Malcolm W.**

Santa Monica, The Rand Corporation. 1956, 21 p.  
Rand Memorandum RM-1678. AD 101 071.

"This material was given as an orientation talk to an Air Force group visiting Rand. Its limited purpose is an elementary exposition of some conceptual issues that are relevant for a critical understanding of Systems Analysis. Many conceptual subtleties and all issues of analytic techniques are avoided." Any rational choice involves the balancing of objectives against the cost of their attainment. This in turn involves several issues: determination of relevant alternatives, establishment of criteria, preparation of a "model", and interpretation of the results of analysis. The author approaches each one of these issues in this memorandum, then concludes with a reminder of the importance of judgment. "It is very clear that Systems Analysis as currently practiced, and probably as practiced in the future, is much more an art than a science."

**Introduction to Systems Cost-Effectiveness**  
**Seller, Karl III**

New York, Wiley-Interscience, 1969, 108 p.

An outgrowth of lecture notes prepared for courses in systems cost-effectiveness, with suggested readings to depth studies of the mathematics involved.

**Introduction.**

- I. Cost Factors: level of use; inheritance; research and development; inputs; outputs (total, variable, fixed, average, marginal costs; optimal return output versus optimal efficiency output; relative activity levels; short-run, long-run costs); time (discounted cost, obtainability cost); performance; geographic location.
- II. System Cost Models: matrix models; cost of elements; model expansion; minimizing total system cost; period costing; time phasing; fixed cost proration; variable cost nonlinearity; cost model aggregation; differential cost models; probabilistic cost.
- III. System Effectiveness Models: probability product model; basic performance (confidence limits, multiple performance parameters); availability; reliability; survivability (microanalysis, macroanalysis); model expansion; maximizing total system effectiveness; period versus mission effectiveness; time phasing; probabilistic effectiveness.
- IV. System Cost-Effectiveness Models: domain of feasibility; homogeneity (time, geography, possession, scale); ratio model (optimal efficiency system versus optimal effectiveness system); indifference curve model (combination of two systems, combination of three and more than three systems, limitations); mathematical programming; theory of games; probabilistic cost-effectiveness; decision making and the cost-effectiveness criterion (technological advances, resource availability, political sensitivity, psychological stimulus).

**Learning Curve Methodology for Cost Analysts**  
**Dahlaus, Frank and Joseph S. Roj**

Washington, Headquarters US Army Materiel Command, 1967, 21 p.  
AD 661 052.

"This paper puts down the main framework of necessary concepts in the application of the learning curve with appropriate references to the literature. Experience shows that, at some point in an analysis, the estimator is required to enter opinions because of lack of data, incomplete knowledge of the process or other causes beyond his control. The emphasis in this paper is to distinguish between mathematics and judgment; between calculation and intuition; putting cautions on the analyst to provide the reviewer with visibility as to where one ends and the other begins. Topics include a description of the forms of the learning curve with distinctions among possible variables, various necessary calculations and conversions, fundamental concepts related to the location of a straight line in two-dimensional space, factors which contribute to learning in industrial processes and adjustments for special circumstances. The document was prepared to provide guidance to cost analysts in the US Army Materiel Command."

- I. Introduction.
  - II. The Learning Model: description; applicability; data collection and uncertainty.
  - III. Calculations and Conversions: fundamental relationship; power expressed as a slope; lot mid-points.
  - IV. Log-linear Learning Curve Analysis: geometry of the straight line; regression analysis.
  - V. Factors Contributing to Learning: improved methods; management learning; debugging of engineering data; production processes and slopes.
  - VI. Engineering and Other Major Changes: effect of engineering changes; adjustment procedures.
  - VII. General Considerations: detailed investigation; responsibilities of the analyst.
  - VIII. Summary.
- Appendix. Learning Curve. Regression Analysis.  
References.

- Volume II. 70-85 Percent Slopes
- Volume III. 86-99 Percent Slopes

Boren, H.E. and H.G. Campbell

Santa Monica, The Rand Corporation, 1970, 3 Vol, 919 p.  
Rand Memorandum RM-6191-PR. AD 708 713, 708 714, 709 178.

"This memorandum comprises three volumes of learning-curve data, including unit curve midpoints for plotting first-lot quantities. Accurate representation of the first-lot quantity is important, because misplacing this point could lead to incorrect conclusions about the cost-quantity relationship. In the past, unit curve midpoints were estimated by various approximation methods because the calculations to obtain tables of true midpoints were complex and laborious. Now, through use of high-speed computers, such calculations can be made quickly and inexpensively. Accordingly, these volumes were prepared to assemble all the information a cost analyst is likely to need in using or plotting learning-curve data."

**Preface.**

**Summary.**

**Life Cycle Management Model for Army Systems**  
**Headquarters, Department of the Army**

Washington, Department of the Army, 1968, 54 p.  
Pam 11-25.

This pamphlet supplements AR 11-25 (which prescribes the process by which Army systems are developed, fielded, and modified) and provides broad guidance for supporting activities.

- I. General: purpose; objectives; description of the life cycle management model; applicability; revision to model; supporting materials and publications; material requirements review committee; machine processing of information under the life cycle management model.
- II. Concept Formulation Phase: general; the Army and joint family of plans; major Army studies; evolution of OCO, QMDO, ADO, QMR, and SDR; the combat development objective guide; prerequisites for contract definition; cost effectiveness analysis; basis of issue, personnel and logistics planning; DA system staff officers; preliminary project manager charter; concept phase system status evaluation; approval to enter contract definition.
- III. Contract Definition Phase: general; source selection; approval of contract definition contractors; analysis of trade offs and appraisal of development proposals; contract definition systems status evaluation.
- IV. Development and Production Phase: general; development and test plans and coordination; training planning; fund programming; test plans and testing; prototype system characteristics SSE; development of doctrine and organizations; development acceptance SSE; program element and publications; production validation SSE; production.
- V. Operations and Disposal Phase: objectives; user field tests and evaluations; review and revision of doctrine and organizations; overhaul, product improvement, and retrofit; revisions to the AMP and the EDP; reclassification; disposal.

**Linear Programming Under Uncertainty**  
**Dantzig, George B.**

Santa Monica, The Rand Corporation, 1954, 18 p.  
Rand No. P-596.

**Summary:** "A class of linear programming models is considered where the activities are divided into two or more stages. The quantities of activities in the first stage are the only ones that can be determined in advance because those in the second and later stages depend on the outcome of random events. Theorems on convexity of the objective (cost) functions are established for the general m-stage case. A complete computational procedure is given for a special class of two-stage problems in which allocations in the first stage are made to meet an uncertain but known distribution of demands occurring in the second stage."

**Management Sciences.**

New York, Pergamon Press, 1959, 2 volumes, 1113 p.

Volume 1: Sessions 1-7; Volume 2: Sessions 8-14.

**Opening of the Conference.**

- Session 1. Management Economics:** limits to the laws of integration and specialization of labor; choosing the best moment for overhaul; on the theory and computation of delegation models, k-efficiency, functional efficiency and goals; the optimum dividend rate; operations research - experience in an underdeveloped economy; the role of economics in management science.
- Session 2. Simulation:** survey in simulation; integration of modelling and simulation in organizational studies; on the feedback approach to industrial systems design; simulation in dynamic models; a study in planning - scheduling using simulation and linear programming methods.
- Session 3. Management Games:** remarks on some experiments in management games; contributions and experiences in management games; a decision game of managerial strategy as a research tool; the appreciation of operational research through a management exercise; business gaming in management science education; the future of management gaming.
- Session 4. Decision Processes:** pricing, investment and games of strategy; mathematical programming in marketing; linear programming under uncertainty; the effect of forecasting errors on optimal programming; the interplay between decision makers; remarks on linear programming with integer solutions.
- Session 5. Computer Systems:** automatic treatment of information and management; comparison of computer approach in Europe and America; use of a computer 'gamma tambour' for the planning of a shop; a computation for the bounded variables problem using FACOM 128 B; on the analysis of structural properties of largescale micro-economic input-output models.
- Session 6. Fundamentals in Management Education.**
- Session 7. Production and Inventory Management:** a model of financial control of inventory in a complex organization; determining cost factors for an inventory model; marginal analysis of lost sales; plant production management; control of finished goods inventory; economic aspects of inventory control.
- Session 8. Measurements in Management.**
- Session 9. Behavioral Sciences.**
- Session 10. Organizational Theory and Management Communications.**
- Session 11. Research and Development Management.**
- Session 12. Long-Range Planning:** a quasi-analytic method for long-range planning; the state of the art in using long-range plans; on

the long-range study of the investments in the French Power Industry; forecasting at the level of a firm or a group of firms.

Session 13. Case Histories.

Session 14. Methodology: management economics and operations research; applied management sciences research in a decentralized industrial firm; management decision making with research information; marketing strategy; operations research approaches to sales incentives and distribution cost analysis; an operational approach to the design of work; problems of inventory under limited capacity; a method for management.

Summation.

Mathematical Analysis for Business Decisions  
Howell, James Edwin and Daniel Teichroew

Homewood, Richard D. Irwin, 1963, 320 p.

This book is written for the student or the business practitioner who needs to learn enough about the literature and understand recent developments in the several fields of business as well as to understand and be able to work with the ever-growing number of specialists who are becoming increasingly important in business, industry, and the government.

- I. Elementary Mathematical Relations: functions; graphs of functions and equations.
  - II. Rates of Change: slope of a line and rate of change; limits and continuity; instantaneous rate of change.
  - III. Differentiation of Functions: elementary differentiation theorems; composite functions; higher-order derivatives; implicit functions; inverse functions.
  - IV. Optimizing Functions of One Variable: Maxima and minima; solving equations.
  - V. Applications of the Derivative: cases; break-even analysis, optimization, and the marginal analysis.
  - VI. Algebraic and Transcendental Functions: exponents and exponentials; logarithmic functions; algebraic functions.
  - VII. Multivariate Functions: functions of several variables; partial differentiation; theory of extrema for multivariate functions; lagrangian multipliers.
  - VIII. Summation and Integration: the definite integral as a sum; the fundamental theorem of the calculus; integration; area.
  - IX. Probabilistic Models: random variables and distribution functions; discrete distribution functions; an application of probability theory.
  - X. The Mathematics of Finance and Accounting: types of interest; uniform periodic payments; present value; cases.
  - XI. Applications to Business Decisions: cases.
  - XII. Linear Systems and Matrices: matrices; matrix solutions of linear systems; subscript notation; existence of an inverse; linear regression analysis.
  - XIII. Linear Programming: the linear programming model; a three-product problem; additional information from LP solutions; applications of linear programming.
  - XIV. Management Science Models: the management science approach; limitations and extensions of the management science approach; the present status of management science.
- Appendix 1. Differentiation Formulas.  
Appendix 2. Integration Formulas.  
Appendix 3. Notes on Probability.  
Appendix 4. Properties of Exponents and Logarithms.  
Appendix 5. Tables.  
Index.

**Mathematical Optimization Techniques**  
**Bellman, Richard**

Santa Monica, The Rand Corporation, 1963, 346 p.  
Rand No. R-396-PR.

"The papers collected in this volume were presented at the Symposium on Mathematical Optimization Techniques held in Santa Monica, California, 18-20 October, 1960. The techniques discussed included recent developments in linear, integer, convex, and dynamic programming as well as the variational processes surrounding optimal guidance, flight trajectories, statistical decisions, structural configurations and adaptive control systems." Part 1: aircraft, rockets, and guidance (chapters 1-4); Part 2: communication, prediction, and decision (chapters 5-9); Part 3: programming, combinatorics, and design (chapters 10-14); Part 4: models, automation, and control (chapters 15-17).

Introduction (Richard Bellman).

- I. A Survey of the Problem of Optimizing Flight Paths of Aircraft and Missiles (Angelo Miele).
  - II. Estimating Performance Capabilities of Boost Rockets (P. Dergarabedian and R.P. Ten Dyke).
  - III. The Optimum Spacing of Corrective Thrusts in Interplanetary Navigation (J.V. Breakwell).
  - IV. The Analysis and Solution of Optimum Trajectory Problems (Stuart E. Dreyfus).
  - V. A New Approach to the Synthesis of Optimal Smoothing and Prediction Systems (Emanuel Parzen).
  - VI. Adaptive Matched Filters (Thomas Kailath).
  - VII. Optimization Problems in Statistical Communication Theory (David Middleton).
  - VIII. Estimators with Minimum Bias (William Jackson Hall).
  - IX. On the Optimal Replacement Rules When Changes of State Are Markovian (C. Derman).
  - X. Simplex Method and Theory (A.W. Tucker).
  - XI. The Present Status of Nonlinear Programming (P. Wolfe).
  - XII. The Number of Simplices in a Complex (Joseph B. Kruskal).
  - XIII. Optimization in Structural Design (William Prager).
  - XIV. Geometric and Game-Theoretical Methods in Experimental Design (G. Elfving).
  - XV. Automation and Control in the Soviet Union (J.P. LaSalle).
  - XVI. The Theory of Optimal Control and the Calculus of Variations (R.E. Kalman).
  - XVII. Mathematical Model Making as an Adaptive Process (Richard Bellman).
- Index.

Mathematical Statistics  
Wilks, Samuel Stanley

Princeton, Princeton University Press, 1943, 284 p.

- I. Introduction.
- II. Distribution Functions: cumulative distribution functions; marginal distributions; statistical independence; conditional probability; the Stieltjes integral; transformation of variables; mean value; moment generating functions; regressions.
- III. Some Special Distributions: discrete distributions; the normal distribution; Pearson system of distribution functions; the Gram-Charlier series.
- IV. Sampling Theory: application of theorems on mean values to sampling theory; sampling from a finite population; representative sampling; sampling theory of order statistics; mean values of sample moments when sample values are grouped, Sheppard corrections, appendix on Lagrange's multipliers.
- V. Sampling from a Normal Population: distribution of sample mean; the  $\chi^2$ -distribution; the student t-distribution; Snedecor's F-distribution; distribution of second order sample moments in samples from a bivariate normal distribution; independence of second order moments and means in samples from a normal multivariate distribution.
- VI. On the Theory of Statistical Estimation: confidence intervals and confidence regions; point estimation, maximum likelihood statistics; tolerance interval estimation; the fitting of distribution functions.
- VII. Tests of Statistical Hypotheses: statistical tests related to confidence intervals; likelihood ratio tests; the Neyman-Pearson theory of testing hypotheses.
- VIII. Normal Regression Theory: case of one fixed variate; case of k fixed variates; a general normal regression significance test; the minimum of a sum of squares of deviations with respect to regression coefficients which are subject to linear restrictions.
- IX. Applications of Normal Regression Theory to Analysis of Variance Problems: testing for the equality of means of normal populations with the same variance; randomized blocks or two-way layouts; three-way and higher order layouts, interaction; latin squares; greco-latin squares; analysis of variance of incomplete layouts; analysis of covariance.
- X. On Combinatorial Statistical Theory: the theory of runs; application of run theory to ordering within samples; matching theory; independence in contingency tables; sampling inspection.
- XI. An Introduction to Multivariate Statistical Analysis: The Wishart distribution; reproductive property of same; independence of means and second order moments in samples from a normal multivariate

population; Hotelling's generalized student test; the hypothesis of equality of means in multivariate normal populations; the hypothesis of independence of sets of variables in a normal multivariate population; linear regression theory in normal multivariate populations; remarks on multivariate analysis of variance theory; principle components of total variance; canonical correlation theory; the sampling theory of the roots of certain determinantal equations.

Literature for Supplementary Reading.

**Mathematics and Statistics for Economists**  
**Tintner, Gerhard**

New York, Rinehart and Company, 1954, 363 p.

This book includes some applications of elementary mathematics to economics, as well as topics in calculus, probability, and elementary statistics.

**Preface.**

**Sources of Numerical Examples.**

- I. Some Applications of Elementary Mathematics to Economics: functions and graphs; linear equations in one unknown; systems of linear equations; quadratic equations in one unknown; logarithms; progressions; determinants; linear difference equations with constant coefficients.
- II. Calculus: functions, limits, and derivatives; rules of differentiation; derivatives of logarithmic and exponential functions; economic applications of the derivatives; additional applications of derivatives; higher derivatives; maxima and minima in one variable, inflection points; derivatives of function of several variables; homogeneity; higher partial derivatives and applications; elements of integration.
- III. Probability and Statistics: probability; random variables; moments; binomial and normal distributions; elements of sampling; tests of hypotheses; fitting of distributions; regression and correlation; index numbers.

Postscript. Suggestions for Further Reading.

Answers to Odd-Numbered Problems.

Tables: four-place common logarithms of numbers; natural trigonometric functions for decimal fractions of a degree; four-place natural logarithms; areas of the normal probability curve; students' t-distribution;  $x^2$  probability scale.

Indexes: names; mathematical and statistical terms; economic terms.

**A Method for Deriving Confidence Estimates in Cost Analysis**  
Yates, E.H.; H.M. Stanfield; D.K. Nance

Santa Barbara, Defense Research Corporation, 1966, 19 p.  
Technical Memorandum 231. AD 811 034.

**Abstract:** "Predictive cost estimates often contain large uncertainties. Bias errors arise from unforeseen requirements, and are difficult to predict. However, a substantial part of the uncertainty is due to incomplete definition of the system elements, and can be treated as a random error, which can be quantified. Large-system cost estimates are made up of many cost elements. If their probability distributions are known, the distribution of the system cost can be obtained. Element cost distributions can be found by applying cost estimating relationships to data on similar elements of known costs, and treating the results as a frequency distribution. In the absence of sufficient data, distributions can be crudely estimated by common-sense procedures. Because the element distributions are generally difficult to define, the system cost distribution has only limited validity. However, predictions of the form 'System cost will lie between A and B with probability p' can be made with considerable confidence if they are restricted to fairly broad intervals, and will bound the estimate much more closely than merely estimating the maximum and minimum possible costs."

**I. Introduction.**

**II. Foundations: kinds of uncertainty; statistical background.**

**III. Estimating Distributions of Cost Elements: basic approach; other techniques.**

**IV. Estimating the Distribution of Total Cost.**

**V. Validity of the Overall Method.**

Methodology Notebook for Action Officers  
Operations Research/Systems Analysis Executive Course

Fort Belvoir, US Army Management School, 143 p.  
GT-501-N.

**Abstract:** "This document presents descriptions, illustrations, and applications of various tools and techniques used in military operations research. Topics covered include the role of operations research in the United States Army Combat Developments Command; the nature of models and their development; simulation; research wargaming; field experimentation in USACDC; troop testing and field evaluation; cost/effectiveness analysis; computer utilization, capabilities, and limitations; human behavioral systems, models, and data collection techniques; human factors analysis; systems analysis, its planning, scheduling, and synthesis of results; and computer applications. A glossary and bibliography are included."

**Part One: Command**

- I. Introduction.
  - II. The Research Problem.
  - III. Models.
  - IV. Simulation.
  - V. Research War Games.
  - VI. Field Experimentation.
  - VII. Troop Testing.
  - VIII. Cost/Effectiveness Analysis.
  - IX. Human Factors Analysis.
  - X. Systems Analysis.
  - XI. Computer Applications.
- Glossary.  
Bibliography.

**Methods and Procedures for Economic Analysis of Proposed Government Investments**

Palmour, Vernon E.; Stephen K. Dietz; Paul H. Earl; Robert R.V.  
Wiederkehr

Westat Research, Inc., 1969, 89 p.  
WR PO-21. AD 855 605.

"The primary purpose of this investigation is, first, to consider the present value (discounted present value) method of aggregating costs and/or benefits over time and, second, the use of this approach in economic analysis of proposed investments in weapon systems. The concept of present value, or discounting as it is sometimes called, will be discussed especially as applied in the comparison of weapon systems. Also analyzed in this report will be the associated problems of choosing a discount rate, the length of planning period and the estimation of residual values, and the treatment of risk and inflation. This investigation is concerned only with the problem of selection between alternative systems in order to accomplish a specified objective. The problem of choosing a set of projects to exhaust a given budget is not treated."

- I. Introduction: general problem of economic choice; scope of present study; major conclusions and recommendations.
- II. The Present-Value Criterion in the Analysis of Proposed Government Investments: the present-value criterion; discount rate (schools of thought, common errors and misconceptions); planning period and residual value; use for selecting alternatives (performance level, alternative system, effect of benefit and cost constraints, the more general case); risk and uncertainty (definitions, other interpretations, when benefits not in dollars, government recklessness, treatment of risk); treatment of inflation in discounting analysis (inclusion and exclusion approaches, conclusions and recommendations).
- III. Economic Analysis of Proposed Investments in Weapon Systems: cost-effectiveness analysis; criteria for selecting between alternative weapon systems; discount rate, inflation, and risk; planning period and residual value; effect of expenditure profile, planning period and interest rate on present value of systems costs.

Appendix. Derivation of an Expression for the Discount Reduction Factor, F.

**Methods for Evaluating the Cost/Effectiveness of Alternative Support  
Plans for Major Weapon Systems**  
**LMI**

Washington, Logistics Management Institute, 1965, 64 p.  
LMI Project 6P. AD 476 471.

**Summary:** "The purpose of the study was to develop and demonstrate certain quantitative techniques or methods as the first steps toward equipping the DOD with improved methods for measuring and evaluating the relative cost/effectiveness of alternative logistics/support programs for such weapon systems. This report contains a description of the measurement methods which we have developed and some examples of how they could be used in logistics/support planning. Some of the methods could be used now in the planning and management of individual weapon systems." The report also deals with the gaps left for study and their relationship to cost/effectiveness measurement.

**Preface.**

**Summary of Report.**

- I. Introduction: background; study assignments (study methods, developments affecting the conduct of the study).
- II. Findings and Discussion: logistics/support planning and management (scope of logistics/support for a weapon system, the F-4 system and the evolution of logistics/support concepts); requirements for improved concepts of cost/effectiveness logistics/support (general, simulations and models).
- III. Model for Measuring Integrated Logistics/Support System Cost/Effectiveness: objectives and criteria; uses of common measures and rules; measurement techniques (definitions, symbology, concepts, measures of total system logistics/cost/effectiveness, cost of a weapon per unit of time).
- IV. Conclusions and Recommendations.

**Methods of Operations Research**

**Military Analysis**  
**Quade, E.S.**

Santa Monica (California), The Rand Corporation, 1965, 36 p.  
Rand Memorandum RM-4808-PR. AD 624 463.

This memorandum points out the need for the application of analytic techniques to military problems and for an understanding of these techniques by military officers. It defines systems analysis, describes its essential features, illustrates the process of analysis with examples, points out its virtues and limitations, and concludes with some remarks about its future.

Introduction.

Definitions.

The Essence of the Method: the objective, the alternatives, the costs, a model, a criterion.

A Narrow Example: Selection of a new aircraft engine.

A Broader Example: Defense of a Missile Force.

The Process of Analysis.

The Virtues.

The Limitations.

The Future.

Concluding Remarks.

**Military Systems Analysis**  
**Quade, E.S.**

Santa Monica, The Rand Corporation, 1963, 29 p.  
Rand Memorandum RM-3452-PR. AD 292 026.

This memorandum was sponsored by the US Air Force under Project Rand and prepared for publication as a chapter in a book, Military Operations Research, Bernard O. Koopman, Editor, to be published by the Operations Research Society of America in its series, Publications in Operations Research. "Systems analysis is an approach to complex problems of choice under uncertainty by systematically examining the costs, effectiveness, and risks of the various alternatives. This Memorandum attempts to survey the problems and procedures of such an analysis when applied to a military context."

**Introduction.**

**Formulation of the Problem:** context; objectives, criteria; hypotheses.

**Search:** facts; probabilities; alternatives; costs.

**Explanation:** model building; approximation; computations; results.

**Interpretation:** nonquantifiables; incommensurables; uncertainties; conclusions.

**Concluding Comments.**

**Military Systems Cost Analysis (A Summary Lecture for the AFSC Cost Analysis Course)**

**Fisher, G.H.**

Santa Monica, The Rand Corporation, 1962, 22 p.  
Rand Memorandum RM-2975-PR.

Summary: "In the context of this memorandum, cost analysis refers to the determination of the probable economic resource impact of future Air Force weapon and support systems. Five major aspects of cost analysis are stressed: understanding the problem or context in which cost estimates are to be used, assembling the basic data, deriving cost-estimating relationships, using these relationships to make an estimate, and presenting the results. Both hardware and nonhardware system cost components are discussed, and the sensitivity of total system cost to variations in the cost and characteristics of these components is considered."

Preface.

Summary.

General Remarks.

The Cost Analysis Process.

Further Comments on Cost-Estimating Relationships.

Hardware Cost Analysis.

Research and Development.

Non-Hardware System Cost Components.

Pulling Together the Total System Cost Estimate.

Weapon System Cost Sensitivity Analysis.

Concluding Remarks.

**Models in Cost-Effectiveness Analysis: An Example**  
**Bryk, Oliver**

McLean, Research Analysis Corporation, 1965, 29 p.  
RAC Paper RAC-P-2. AD 622 109.

This paper describes some approaches to modeling for systems analysis or cost-effectiveness studies.

Introduction: elements of cost-effectiveness analysis; role of models; objective; conceptual design of the models; description of models (effectiveness, systems, cost, cost-effectiveness models).

**Modern Research for Administrative Decisions**  
Hough, Louis

Englewood Cliffs, Prentice-Hall, 1970, 609 p.

This book attempts to meet the need for broad familiarity with methods, suggestive theory, and practical guidance in modern decision theory.

- I. Scientific Techniques in Administration: controlled quantitative investigation; the scientific pursuit of knowledge; the need for administrative research.
- II. Procedural Concepts in Scientific Research: rationalism versus the analysis of data; system of explanation; scientific methods and truth; the development of the research problem; discovering working hypotheses; statistical design in experiments.
- III. The Structure of Administrative Research: adaptation and control; a new administrative technology; the operations research movement; the managerial applications; difficulties in the research; pure research in administration; the phases in an investigation.
- IV. The Elements of Decision Theory: microeconomic decisions and the research requirements; an illustration; and algebraic model of the decision criteria; appraising the theory.
- V. Objectives and Criteria for Decisions: suboptimization; the objectives of business decisions; maximizing utility; contentment levels.
- VI. Research Problems and Administrative Diagnosis: methods as a guide to research; the dominance of the problem; utilizing existing data; the identification of problems; stating the problem.
- VII. Predictive Models and Simulations: decisions and predictions; assumptions and validity; the model-building sequence; the classical model of gravitation; the rent or buy model.
- VIII. The Various Forms of Administrative Models.
- IX. Selecting the Variables.
- X. The Model Building Process.
- XI. Standard Theoretical Models.
- XII. Estimating Parameters and Applying the Model: the parameters and the data; verification; revision; manipulation; making the choice.
- XIII. Management by Multistage Models.
- XIV. Computerization in Administrative Research.
- XV. Research for Inventory Decisions.
- XVI. An Introduction to Queue Theory.
- XVII. The PERT Network for Scheduling.

XVIII. The Elements of Linear Programming.  
XIX. The Assignment Problem.  
XX. The Transportation Method.  
XXI. The Simplex Method.  
XXII. Linear Programming Research.  
XXIII. Monte Carlo Research Techniques.  
XXIV. The Analytic Study of Total Systems.  
XXV. Information for System Administration.  
Appendix A. Developing the Fundamental Data.  
Appendix B. Mathematical Rates of Change.  
Appendix C. Bayesian Probability Theory.

**A Monte Carlo Simulation Approach to Cost Uncertainty Analysis**  
Schaefer, Donald F.; Frank J. Husic; Michael F. Gutowski

McLean, Research Analysis Corporation, 1968, 82 p.  
Economics and Costing Department Study 009.135. AD 850 054.

**Abstract:** "An important aspect of cost research is the measurement of the uncertainty inherent in the projection of system cost. Approaches to this problem have in the past centered on intuition of the decision maker or in sensitivity analysis. Only recently have approaches utilizing such tools as statistical decision theory and probability theory been formulated. This study focuses on the Monte Carlo simulation approach to uncertainty in cost analysis. This approach requires: (a) expression of input estimates as probability distributions reflecting uncertainty, and (b) cost equations pertinent to a particular model. The Monte Carlo simulation approach then generates: (a) the frequency distribution for system cost, and (b) statistical measures that illustrate the nature and magnitude of system cost uncertainty. Two models are developed, the Beta model and the Weibull model, each of which reflects a particular distribution form for the inputs. The relative costs and advantages of each model are compared. A user's guide to the program and complete program listings are presented in the appendix."

**Foreward.**

**Abstract.**

**Introduction.**

**Cost Undertainty Analysis: An Overview:** cost uncertainty in decision making (value of probability information); methodology (overview of logic, beta variant, Weibull variant); model input requirements (beta model, Weibull model); output format; computer time requirements; conclusions.

**Appendix. User's Guide to Beta and Weibull Programs:** Weibull input requirements; beta input requirements; error messages; computer hardware and software requirements; program logic; Weibull program listing; beta program listing; computer program flow charts.

Graver, C.A. and H.E. Boren, Jr.

Santa Monica, The Rand Corporation, 1967, 138 p.  
Rand Memorandum RM-4879-PR. AD 655 768.

Summary: "This memorandum presents a statistical study of a regression function of the form  $Y = e^{\mu_0} X_1^{\mu_1} X_2^{\mu_2} \dots X_p^{\mu_p}$ . The study is concerned primarily with (1) how to pick the best values for the unknown parameters  $(\mu_0, \mu_1, \mu_2, \dots, \mu_p)$  given a set of historical data  $(Y_i, X_{i1}, X_{i2}, \dots, X_{ip}, i = 1, 2, \dots, n)$ , and (2) how to describe the predictive capability of the choice in (1)."

**Preface.**

**Summary.**

**I. Introduction.**

**II. The Multiplicative Model:** assumptions and implications of the case (median case, mean case); estimators of the parameters; distribution of the estimators; prediction intervals.

**III. The Additive Model:** general model; estimations; distribution of the estimators; prediction interval.

**IV. Comparison of the Models.**

**V. Computer Program:** introduction; restrictions; sequence of operations; input procedures (title card, order card, format card, data cards, blank card, summary of input cards); outputs; future studies.

**Appendix A. Matrix Definitions and Operations:** matrix; equality of matrices; matrix operations (addition, scalar multiplication, matrix multiplication); special matrices (square matrix, identity matrix, transpose matrix, symmetric matrix, inverse matrix, positive definite matrix).

**Appendix B. Statistical Facts and Relationships:** measures of central tendency (the expected value or mean of  $X$ , median of  $X$ ); percentiles of a continuous random variable; measures of variability (variance, covariance, covariance matrix); linear combinations of random variables; distributions related to the normal (chi-square distribution, the  $t$ -distribution).

**Appendix C. Conversion of  $e^{\mu_0}$  to  $\mu_0$ .**

**Appendix D. Absolute Minimum and Positive Definiteness of the Matrices of Second Partial:** general discussion; specific case.

**Appendix E. Variance-Covariance Matrix.**

New Tools for Planners and Programmers  
Novick, David

Santa Monica, The Rand Corporation, 1961, 21 p.  
Rand No. P-2222.

"It is the purpose of this paper to discuss (1) some of the conditions which make the current decision-making machinery inadequate, and (2) new tools which can meet the needs of the planners and decision makers."

**The Normative Interest Rate**  
**Berman, E.B.**

Santa Monica, The Rand Corporation, 1959, 39 p.  
Rand No. P-1796. AD 663 408.

"The normative interest rate is defined as the discount rate the government ought to use in making its investment decisions. In this paper, various alternative ways of setting the level of the normative interest rate are examined . . . . The appropriate normative interest rate is then determined as a rate that is consistent with itself through the rate of growth of national product and the rate of decline in the marginal utility of national product that it implies."

**Introduction.**

- I. Welfare Return and Investor's Return: incremental taxation; risk premium; direct gains.
- II. Three Traditional Devices for Setting the Level of the Normative Interest Rate: rate of return on marginal private investment; national time preference; long-term government bond rate.

On the Choice of Objectives in Systems Studies  
Hitch, Charles J.

Santa Monica, The Rand Corporation, 1960, 13 p.  
Rand No. P-1935.

An essay on the choice of objectives. There are three difficulties in determining the right objectives:

- (1) "It is impossible to define appropriate objectives without knowing a great deal about the feasibility and cost of achieving them. And this knowledge must be derived from the analysis."
- (2) There frequently is no national or other high level objective that can be taken as "given".
- (3) "Objectives are multiple and conflicting, and alternative means of satisfying any one are likely to produce substantial and differential 'spillover' effects on others."

"Learning about objectives is one of the chief objects of systems analysis. We must learn to look at objectives as critically and as professionally as we look at our models and our other inputs. We may, of course, begin with tentative objectives, but we must expect to modify them or replace them as we learn about the systems we are studying - and related systems. The feedback on objectives may in some cases be the most important result of our study."

On the Construction of a Mathematical Theory of the Identification of  
Systems  
Bellman, Richard

Santa Monica, The Rand Corporation, 1966, 13 p.  
Rand Memorandum RM-4769-PR. AD 642 578.

This memorandum discusses some of the problems involved in the formulation of a mathematical theory for system identification. By system identification is meant the task of determining the structural parameters on the basis of observations over time and position of the inputs and outputs.

On Discounting and Risk in Military Investment Decisions  
Broussalian, V.L.

Washington, D.C., The Franklin Institute (Systems Evaluation Group,  
Center for Naval Analyses), 1966, 12 p.  
SEG Research Contribution No. 10. AD 641 170.

A revised version of an earlier paper entitled "Discounting, Bias and Risk in Military Investment Decisions: A Theoretical Discussion."  
Abstract: "The term, discounting, is often applied indiscriminately to two distinct operations. One operation, which attempts to simulate the capital market's evaluation of an investment, represents a conceptual exchange between current and future income resulting in a 'present value'. The other refers to an essentially subjective revision, normally downward, of an expected future benefit or cost, for any of a number of reasons. It is pointed out that in the case of a military effectiveness stream (a typical example of a non-marketable benefit stream), it is meaningful to discount in the first sense. On the other hand, whereas discounting in the second sense could be meaningfully applied, there is no single rate which the analyst acting on behalf of the decision-maker can apply. The practice of raising the discount rate by a premium to take care of risk and uncertainty may be appropriate when discounting in the second sense."

Abstract.  
The Two Senses of Discounting.  
"Discounting" on Account of Risk.

On the Role of the Cost Analyst in a Weapon System Study  
Kermisch, J.J. and A.J. Tenzer

Santa Monica, The Rand Corporation, 1966, 22 p.  
Rand No. P-3360. AD 636 497.

This study makes the following two points: (1) that the role of the cost analyst is not to appear after decisions are made and provide some kind of estimate which justifies the decisions, and (2) that cost analysis is not an activity which is carried out by itself, but is an important part of a larger analytic activity which is sometimes called systems analysis, sometimes cost-effectiveness analysis, and sometimes cost-utility analysis.

On the Theory of Dynamic Programming  
Bellman, Richard

Santa Monica, The Rand Corporation, 1952, 48 p.  
Rand No. P-300.

Summary: "Some general problems are formulated and the existence and uniqueness of the analytic equivalents are proved. A discussion and solution of a number of simple examples are given."

Operations Research - Methods and Problems  
Sasieni, Maurice; Arthur Yaspen; Lawrence Friedman

New York, John Wiley & Sons, 1959, 316 p.

This book deals with a selection of the mathematical techniques that have been found useful in operations research. The approach is mainly through the medium of worked examples, against a background furnished by some discussion of the relevant problem area.

- I. Introduction.
- II. Probability: simple events; composite and related events; discrete distributions; continuous distributions.
- III. Sampling: types; estimates from samples; curve fitting; simulated sampling.
- IV. Inventory: known demand; probabilistic demand; probabilistic demand with production lead time.
- V. Replacement: capital equipment that deteriorates with time; items that fail completely; staffing problems.
- VI. Waiting Lines: Poisson arrivals and exponential service times; Poisson arrivals and Erlang service times; Monte Carlo solutions.
- VII. Competitive Strategies.
- VIII. Allocation: the assignment problem; the transportation problem; the linear programming problem; the simplex method; applications of linear programming.
- IX. Sequencing: processing each of  $n$  jobs through  $n$  machines; the traveling salesman problem.
- X. Dynamic Programming: problems with a finite number of consecutive decisions; problems with an indefinite number of consecutive decisions.
- Appendix 1. Finite Differences.
- Appendix 2. Differentiation of Integrals.
- Appendix 3. Row Operations.
- Index.

**Operations Research/Systems Analysis Glossary**  
**Operations Research/Systems Analysis Executive Course**

Fort Belvoir, US Army Management School, 28 p.  
AM-605-N.1.

Short vocabulary reference to aid the student in familiarizing himself with the specialized vocabulary of operations research and systems analysis.

**Planning, Programming, Budgeting: a Systems Approach to Management**  
Lyden, Fremont and Ernest G. Miller

Chicago, Markham Publishing Company, 1967, 443 p.

The readings in this book have been assembled to provide the contemporary public manager or student of public administration with information on what the PPB approach to budgeting is, how it has developed to this point in time, how it relates to other kinds of budgeting approaches, how it is related to and underpinned by systems analysis generally, how it may be applied, and what its limitations and deficiencies may be. Part 1: PPB in perspective (chapters 1,2); Part 2: budgeting and political process (chapters 3,4); Part 3: approaches to planning and program budgeting (chapters 5-7); Part 4: the PPB approach to budgeting (chapters 8-12); Part 5: the system base of PPB (chapters 13-16); Part 6: applications and critique of PPB (chapters 17-19).

**Problems in the Use of Discounting**  
**Cownie, John**

Washington, DC, Office of the Assistant Secretary of Defense (SA)  
Economics, 1967, 11 p.

"This paper describes and briefly evaluates some of the objections which have been raised against the use of discounting in DOD cost analysis. Some objections may be entirely misconceived, but many have a sort of partial validity; arguments from the latter group often serve the function of delimiting the areas within which the discounting procedure is properly applicable. The function of 'answers' to such objections is not to rationalize them away, but rather to specify clearly the restrictions which they impose upon the use of discounting."

Science Park, HRB-Singer, 1967, 58 p.  
Singer Report S-160. AD 813 331

**Abstract:** "This report presents one method of evaluating uncertainties. The cost analyst estimates for each significant system cost or requirement a high and low value. In addition, he selects one of nine Beta distributions which he feels best describes the uncertainties associated with the cost or requirement. Each distribution and its associated data are then inserted into a total life cycle system cost model and combined through a series of computer routines using a Monte Carlo sampling technique, to establish a single distribution. This distribution is plotted as a histogram which represents the uncertainties associated with probable total system cost."

Program Budgeting . . .  
Novick, David, Editor

Santa Monica, The Rand Corporation, 1965, 236 p.

Preface: This book concentrates on the program aspects of the budget. It avoids problems of fiscal policy, revenue, and related issues.

Part 1: government decision making and the program budget (chapters 1,2); Part 2: actual and potential applications of the program budget idea (chapters 3-8); Part 3: implementation and operation (chapter 9).

- I. Conceptual Framework for the Program Budget (Arthur Smithies).
- II. The Role of Cost-Utility Analysis in Program Budgeting (Gene H. Fisher).
- III. The Department of Defense (David Novick).  
Appendix. Illustrative Example of Cost-Utility Considerations in a Military Context (Gene H. Fisher).
- IV. The Space Program (Milton A. Margolis and Stephen M. Barro).
- V. Transportation in the Program Budget (John R. Meyer).
- VI. Education in the Program Budget (Werner Z. Hirsch).
- VII. Federal Health Expenditures in a Program Budget (Marvin Frankel).
- VIII. Program Budget for Natural Resources Activities (Werner Z. Hirsch).
- IX. Problems, Limitations, and Risks (Roland N. McKean and Melvin Anshen).

**Project Modelling: A Technique for Estimating Time-Cost-Performance  
Trade-Offs in System Development Projects**

Zachau, E.V.W.

Santa Monica, The Rand Corporation, 1969, 94 p.  
Rand Memorandum RM-5304-PR. AD 691 810.

Summary: "This memorandum outlines a preliminary methodology for estimating time-cost-performance trade-offs to help with the planning of system development projects. In addition to describing how the models might be constructed, this study discusses how the information derived from them could be used in the system planning process, and focuses on some important methodological problems that must be solved in order to make the project modelling approach operational."

**Preface.**

**Summary.**

- I. Introduction: the structure of system development decisions; four reasons why project trade-offs are difficult to measure; an outline of the project modelling approach.
- II. Formulating Project Models: introduction; the system design model; the project schedule model; gathering activity cost function estimates; synthesizing the system model and the schedule model.
- III. Using Project Models: the project model as a trade-off function; replanning projects using feedback information; analyzing and reducing the effect of uncertainty with project modelling; using project modelling within the framework of current DOD and AF management practices.
- IV. Extensions and Needed Research: developing efficient computational methods; developing extensions to the basic approach; conducting field studies.

**The Quantity versus the Quality for the Data Used in the Derivation  
of a Cost Estimating Relationship**  
**Zumnan, Morris**

Arlington, Institute for Defense Analyses (Cost Analysis Group),  
1969, 29 p., Research Paper P-481. IDA Log No. HQ 69-10701.  
AD 699 131.

Presented at the Joint National Meeting of the Operations Research Society of America and the American Astronomical Society, 18 June 1969. Summary: "One of the most important, time consuming, and expensive steps necessary in the development of a cost model is the collection and analysis of data that will be used to derive the model's cost estimating relationships. Tradeoffs on how a cost analyst might best allocate his time between collecting the data on additional programs and analyzing in further detail the data already in his possession are presented. The measure of the cost analyst's productivity is the reduction in the confidence bandwidth about the cost estimate. These trade-off curves indicate that the cost analyst rapidly runs into the law of diminishing returns for effort expended gathering additional data and/or refining the data in his possession when his productivity is measured as the reduction in the confidence bandwidth about the cost estimate. Curves and equations showing the ratio of confidence bandwidth for an estimate derived from a data base of size  $n$ , to the confidence bandwidth for an estimate derived from an infinite data base are presented for both the cases where the costs are assumed to have a normal distribution and a log normal distribution. The analyses presented are only applicable to confidence statements that are made about estimates for a single future occurrence and not for estimates about a population mean. It is argued that the uncertainty about an estimate is caused by essentially three factors, the randomness of the actual cost distribution, the randomness of the cost estimator's distribution, and the bias of the estimator. For most practical problems only the estimator's variance can be reduced by increasing the data base size and refining the data. The cost randomness and estimator bias are essentially independent of the data base size and degree of refinement."

Foreward.

Summary.

- A. Basic Assumptions: measure of productivity (cost randomness, estimator bias, randomness of the estimator); preparation of CERs.
  - B. The "Quantity" versus "Quality" Trade-Off.
- Appendix. Confidence Bandwidths for the Log Normal Distribution.

**Quasilinearisation and Nonlinear Boundary-Value Problems**  
Bellman, Richard E. and Robert E. Kalaba

Santa Monica, The Rand Corporation, 1965, 208 p.  
Rand No. R-438-PR. AD 470 684.

"This volume is intended as an introduction to quasilinearization, aimed both at those who are solely interested in the analysis, and those who are primarily busied with applications . . . . The objectives of the theory of quasilinearization are easily stated. First, we desire a uniform approach to the study of the existence and uniqueness of the solutions of ordinary and partial differential equations subject to initial and boundary-value conditions. Furthermore, we want representation theorems for these solutions in terms of the solutions of linear equations. Finally, we want a uniform approach to the numerical solution of both descriptive and variational problems which possesses various properties and rapidity of convergence." Bibliography follows each chapter.

**Introduction.**

- I. The Riccati Equation: Newton-Raphson method; multidimensional version; square roots; quasilinearization; Riccati equation; first order linear equation; solution of Riccati equation; upper and lower bounds; successive approximations; monotonicity; a fundamental lemma.
  - II. Two-Point Boundary-Value Problem for Second-Order Differential Equations: inhomogeneous equation; vector-matrix approach; Green's functions; convexity; quasilinearization; existence and boundedness; convergence; general second-order nonlinear differential equations; calculus of variations; solution of inner problem; dynamic programming; invariant imbedding.
  - III. Monotone Behavior and Differential Inequalities: positivity result; characteristic values; variational approach.
  - IV. Systems of Differential Equations, Stochastic and Differential Approximation: quasilinearization applied to systems; solution of linear system, multipoint boundary-value problems; simultaneous calculation of approximations; back and forth integration; a renewal equation.
  - V. Partial Differential Equations: parabolic, elliptic, Hopf-Lax.
  - VI. Applications in Physics, Engineering, and Biology.

**Resource Analysis and Long-Range Planning**  
**Novick, David**

Santa Monica, The Rand Corporation, 1963, 22 p.  
Rand Memorandum RM-3658-PR. AD 406 844.

Summary: "Program budgeting, cost effectiveness, and cost analysis are terms used with increasing frequency in our military establishment. This memorandum discusses each of the terms, with emphasis on cost analysis, and shows how the concepts that they represent are important for Air Force long-range planning. Since this memorandum is intended primarily for persons who must provide inputs to, as well as use the results of, cost analyses, examples are given of the kind of detailed information required."

**Resource Analysis in Military Long-Ranging Planning**  
Novick, D.

Santa Monica, The Rand Corporation, 1964, 13 p.  
Rand No. P-2861. AD 431 524.

"Military planning in the Department of Defense is now administered through the program budget procedure. This arrays the national security objectives in terms of major missions and the major systems for accomplishing them. In this process a wide range of alternative equipments are considered as well as varying possibilities for deployment or operation of them. Each possibility is translated in terms not only of military effectiveness but also of the cost of obtaining and operating that capability. This paper discusses the elements of the new decision-making process introduced by Robert McNamara in 1961."

**Fisher, G.H.**

Santa Monica, The Rand Corporation, 1964, 39 p.  
Rand Memorandum RM-4279-RC. AD 608 055.

"This memorandum outlines the main characteristics of cost-utility analysis and some of the major considerations involved in carrying out such an analysis.

Preface.

Summary.

Introduction.

What is Cost-Utility Analysis?

The Primary Purpose of Cost-Utility Analysis.

Some of the Major Considerations Involved in Doing Cost-Utility

Analysis: proper structuring of the problem and design of the analysis; the conceptual framework; building the model; treatment of uncertainty; treatment of problem associated with time; validity checking; qualitative supplementation; summary comments.

A Military Illustrative Example: general statement of the problem; further consideration of the problem; some considerations in the strategic bombardment area; summary analyses of cost and utility; a purely qualitative analysis; a sub-system illustrative example.

A Non-Military Example: the project's estimated utility; cost considerations; summary of utility considerations; ranking of projects.

Summary of the Chapter.

**The Simple Mathematics of Maximization**  
**Enthoven, Alain G.**

Santa Monica, The Rand Corporation, 1959, 70 p.  
Rand No. P-1833.

"Formulated in economic terms, a problem of choice can often be reduced to that of determining the maximum or minimum of a function of variables that are constrained to lie within a limited region. The function is an index of the extent to which some objectives or set of objectives has been achieved. It provides a ranking of all possible combinations of the variables on which it depends, at least in the region of interest. The variables represent the extent to which various resources are employed in the achievement of the objective. Their values are constrained to lie within a limited region corresponding to the resources available because the resources are limited."

**Some Interest Rate Aspects of Weapon Systems Investment Policy**  
**Gubin, B.**

Arlington, Institute for Defense Analyses (Weapons Systems Evaluation Division), 1965, 70 p.  
Research Paper P-171.

"This paper presents a formal examination of the theoretical basis for the use of interest rates in weapons systems evaluations and an analysis of economic data that yield a numerical estimate of a suggested rate of interest. The model on which the interest rate concept is based uses techniques that economists have used in analysis of consumer behavior and in some monetary theory. The novel aspects of the model are the kinds of data used and the emphasis placed on Department of Defense problems."

Introduction.

Conclusions.

Definitions.

Discussion: the place of interest in a simple optimizing model; the place of interest in DOD planning; rates of return applicable to DOD investment decisions.

Appendix. Current Government Interest Rates Outside the Department of Defense.

Some Curve-Fitting Fundamentals  
Petruschell, R.L.

Santa Monica, The Rand Corporation, 1968, 134 p.  
Rand Memorandum RM-5766-SA. AD 680 613.

Prepared for the Office of the Assistant Secretary of Defense (Systems Analysis). Summary: "Much of the difficulty cost analysts have with curve fitting results from an inadequate grounding in the analytic geometry of the empirical equations with which they work. This Memorandum attempts to provide a concise but relatively thorough discussion of this subject while at the same time demonstrating selected methods for doing mechanical curve fitting. The material is presented in three parts. Section I discusses the properties of the straight line, the exponential, the power function, and the parabola. Included in the discussion of the exponential are the laws for exponents and hence logarithms. Emphasis is on providing insights into the impact of the parameter values on the form of the resultant curves. Graphical illustrations are used extensively. Section II presents different methods of using these curves to describe the relationship between two variables. It discusses the method of selected points, the method of averages, and the method of least squares, making considerable use of scatter diagrams. It describes a number of measures of goodness of fit including the standard deviation, the coefficient of variation, and an average percent deviation. Throughout this section, computational procedures are carried out in complete detail. The discussion of curve fitting is continued in Section III, where cases with more than two variables are considered. By using the method of successive approximations, the initial discussion attempts to convey the idea of a net relationship between two variables, eliminating influence of any others, and thus to clarify the meaning of the coefficient in the multivariate linear equation. The method of least squares is shown to produce the same results as did the method of successive approximations and with significantly less computational effort. The discussion turns next to the nonlinear case. Each of the functional forms described earlier - the exponential, the power function, and the parabola - is used to describe a nonlinear relationship between three variables. Although the method of successive approximations may be used for fitting curves to nonlinear relationships, only the method of least squares is described. The decision to discuss the analytics and the curve-fitting methods in separate sections of the Memorandum was purely arbitrary. For many purposes, the user of this material will want to combine his readings in the first section with his readings in subsequent sections. The parallel nature of the presentations in each section was designed to facilitate this."

**Preface.**

**Summary.**

- I. Curve Fitting and Empirical Equations: introduction; some basic analytic geometry (straight line, parabola, exponential, power function).
  - II. Fitting Curves to Two-Variable Relationships: straight line (selected points, averages, least squares); parabola (form 1, form 2); exponential; power function.
  - III. Three-Variable Curve Fitting: linear case; nonlinear case.

**Standard Rates for Costing Military Personnel Services**  
**Office of the Assistant Secretary of Defense (Comptroller)**

Washington, Department of Defense, 1970, 7 p.  
DODI 7220.25.

This instruction prescribes the standard rates to be used in computing costs of military personnel services as an element of operating expenses.

- I. Purpose.
  - II. Cancellation.
  - III. Applicability.
  - IV. Standard Rates.
  - V. Elements of the Standard Rates: basic pay; basic allowance for quarters; miscellaneous expense; incentive and special pay (aircrew and submarine pay, other hazardous duty, physicians and dentists, sea and duty at certain locations, proficiency pay, hostile fire pay); retirement entitlement accrual.
  - VI. Effective Date and Implementation.
- Enclosure 1. Elements of the Annual Standard Rates - FY 1971.

Statistical Cost Estimating Relationships - Some Basic Issues  
(Aircraft Examples)  
Matry, Harry P.

Washington, Office of the Assistant Secretary of Defense (Systems  
Analysis), 1966, 25 p.  
TP 66-3. AD 659 321.

This paper discusses some of the basic issues of statistical cost  
estimating relationships and describes briefly some of the recent  
studies which have attempted to develop such CERs on aircraft programs.

- I. Purpose.
- II. The Major Characteristics of Statistical CER Techniques.
- III. The Cost Estimating Task Addressed Here.
- IV. Why CERs?

Statistical Manual: Methods of Making Experimental Inferences  
Churchman, C.W.

Philadelphia, Pitman-Dunn Laboratory, 1951, 214 p.

"This manual attempts to emphasize clarity in the method of applying statistical tests, together with the logic of their application. The manual minimizes to the greatest possible extent the mathematical and technical foundations of the methods; it presents only those terms that are presumably essential in understanding the logic of statistical methods and the steps in their application."

Introduction.

Glossary.

- I. Some Standard Procedures: test of a mean, variance known; test of a mean, variance unknown; test equality of two means, variance known; test equality of two means, variance unknown; test of equality of means of paired differences; test of equality of a set of means, variance known; test of equality of a set of means, variance unknown; test of a simple variance; test of equality of two variances; test of equality of a set of variances; test of equality of two probabilities; factorially designed experiments; test of equality of a set of means and variances; test of correlation; tests of normality; test for erratic observations; test for independence of observations; test for proportion of a universe in the tail.
- II. Estimation: common point estimates; confidence intervals; estimate of slope and intercept, both variables subject to error; estimate of mean and variance for sensitivity data.
- III. Sequential Analysis: test of a probability; test of equality of two probabilities; test of a mean, variance known; test of a variance.
- IV. Simplified Procedures: statistical sign test; ranking tests for differences; test of runs of some property of the observations; test of differences among a set of universes.

Tables and Figures.

Statistical Methods for Decision Making  
Chance, William A.

Homewood, Richard D. Irwin, 1969, 442 p.

This book is intended to serve as an introduction to the wide range of statistical methods which are available to the modern decision maker. This range includes the traditional statistical methods which have served so well for many years, as well as techniques of Bayesian analysis which have regained major impetus in the last decade. Attention is also given to the category of statistical inference commonly designated as 'nonparametric statistics.'

- I. Probability and Uncertainty: uncertainty and risk; probability and uncertainty; basic properties of uncertainty; experiment, sample space, events; rules for calculating probabilities; conditional probability; rules for counting; comparison of the binomial and the hypergeometric distribution; probability and experience.
- II. Tests of Hypotheses, Part 1: flow diagram; the Wilcoxon test; role of information; the null hypothesis and its alternatives; logarithms.
- III. Random Variables and Probability Distributions: expected values; mean and variance; standard deviation; Tchebycheff's inequality; graphs of discrete probability distributions; the median and the mode; cumulative probability distributions; skewness and kurtosis.
- IV. The Binomial Distribution and the Normal Distribution: characteristics; tables; appropriateness; the Bernoulli model; approximating hypergeometric probabilities with binomial probabilities; large samples; the standardized normal distribution.
- V. Samples, Frequency Distributions, and Sampling Distributions: populations and samples; purpose of randomness; sample statistics; finite and infinite populations.
- VI. Tests of Hypotheses, Part 2: decision errors; student's *t*-distribution; types of tests.
- VII. Estimation Procedures: regression and correlation analysis; terminology and notation; the model; the scatter diagram; the regression equation; the problem of prediction; the coefficient of determination; a test for the significance of the relationship.
- VIII. Fitting a Probability Distribution to a Set of Data.
- IX. Simulation, Monte Carlo Methods.
- X. Some Elements of Statistical Decision Theory: determination of the costs associated with the state of the process; determination of the conditional costs resulting from the testing procedure; procedure for minimizing expected cost; Bayes' theorem; the role of sample information.

Appendix. Statistical Analysis and the Computer

Tables: selected values of Wilcoxon's distribution; binomial distributions; areas under the normal curve; random digits; critical values of student's  $t$  for specified degrees of freedom; critical values of  $\chi^2$  for specified degrees of freedom; four-place logarithms; logarithms of factorials.

Index.

Statistical Theory  
Lindgren, B.W.

New York, MacMillan Company, 1962, 427 p.

This book expounds clearly and objectively some modern statistical theory, together with the elements of the more classical theory of statistics, in a mathematical setting that can be completed and amplified at a later stage.

- I. Probability Models: model spaces; probability spaces; dependence and independence.
- II. Univariate Distributions: distribution of probability in the space of values; expectation; moments and generating functions; some useful discrete models; continuous cases.
- III. Several Random Variables: bivariate distributions; multivariate distributions.
- IV. Sums of Random Variables: distribution of a sum; distribution of a sum of independent variables; limit theorems.
- V. Statistical Problems and Procedures: utility, loss and regret; the no-data decision problem; sampling; using data in decisions; sufficient statistics; some properties of procedures; monotone problems and procedures; sample size and cost of sampling.
- VI. Estimation: some properties of estimators; determination of estimators.
- VII. Testing Hypotheses: simple  $H_0$  and  $H_1$ ; composite hypotheses; sequential tests.
- VIII. Some Distribution Theory: order statistics and related distributions; distributions related to normal populations.
- IX. Some One-Sampling Problems: goodness of fit; some special one-parameter models; normal populations; a large-sample test for the mean; location as measured by the median; randomness.
- X. Comparisons: based on sample distribution functions; large sample comparison of means; bernoulli populations; normal populations; nonparametric comparison of locations.
- XI. Linear Models and analysis of variance: regression; analysis of variance; a general linear model.

**Statistics in Cost Prediction Problems and Potential  
Piccarriello, Harry**

Washington, Office of the Assistant Secretary of Defense (Systems  
Analysis), 1966, 10 p.  
TP 66-5. AD 659 322.

"A discussion of the application of statistical techniques for  
determining cost estimates (predictors), in particular: a) why the  
use of statistics, b) problems associated with their use, and c) some  
possible approaches which avoid the problems or may lead to a solution  
of these problems."

Introduction.

Why the Use of Statistics.

Problems: normal regression analysis; separate estimation of  
components parts.

Other Approaches: historical simulation; direct estimation of total  
costs; selection of functional forms.

Summing Up.

**Structuring Cost Effectiveness Analyses**  
**Abert, James G.**

**Logistics Review and Military Logistics Journal, Vol. 11, No. 7,**  
**1960, pp. 19-34.**

"The objective of this paper is to set forth in relatively simple terms an analytical framework for structuring cost-effectiveness studies and to point out some of the pitfalls involved in framing these studies. The main emphasis is on the problem associated with time phasing in the design of cost-effectiveness studies and the evaluation of what are called, in the paper, time-phased cost and effectiveness profiles."

**I. Introduction.**

**II. Types of Cost Effectiveness Analysis: equal cost; equal effectiveness; unequal cost/effectiveness.**

**III. Evaluating the Economic Effects of Time-Phased Costs.**

**IV. Discounting as a Means of Evaluating Alternative Resource Allocations.**

**Appendix. The Use of Discounting in Computing Program Costs; Calculating the Resource Impact of Investment Expenditures; Calculating the Impact of Operating Costs.**

"A Suggested Treatment of Time-Distributed Expenditures in Defense Systems Analysis"  
Niskanen, W.A.

Arlington, Institute for Defense Analyses (Economic and Political Studies Division), 17 October 1966, 17 p.  
Internal Note N-39t(R). Log No. IDA/HQ 66-5423.

A paper presented at the 30th national meeting of the Operations Research Society of America at Durham, North Carolina, on 17 October 1966.

This paper argues "that the maximization conditions for either the government or the economy suggest the use of a consistent set of rules for the aggregation of costs for all systems analyses. These rules apply to the three primary problems of aggregating systems costs: (a) selection of the planning period, (b) estimation of the value of resources at the beginning and end of the planning period, and (c) selection of the rate of interest for present value computations. In several cases, a roughly accurate rule-of-thumb is suggested as a substitute for the conceptually precise rule. Special attention is focused on the rationale for the use of interest in systems analyses and on the selection of the appropriate rate."

**Survey of Use by Federal Agencies of the Discounting Technique in  
Evaluating Future Programs  
The Comptroller General of the United States**

**Report to the Joint Economic Committee, Congress of the United  
States, 28 January 1968, 32 p.**

"The General Accounting Office has made a survey of the use by 23 selected Federal Agencies of the technique of discounting in making evaluations of future programs. The nature of the discounting technique is described in the background section of this report. The survey was made pursuant to the Budget and Accounting Act, 1921 (31 U.S.C. 53), and the Accounting and Auditing Act of 1950 (31 U.S.C. 67). The survey was performed in Washington, DC, and was completed in December 1967 . . . . The survey was directed primarily toward determining the extent to which the discounting technique is presently employed by Federal agencies and the extent to which those agencies not employing this technique plan to do so and toward identifying the discount rates currently in use by the agencies. We did not evaluate the appropriateness of the agencies' stated policies and practices as they were revealed to us, neither did we examine into the actual discounting techniques and practices followed by the agencies or into other policies and practices used by them when evaluating Federal programs."

**Letter to the Committee from the Comptroller General.**

**Introduction.**

**Back ground:** explicit and implicit discount rates; effect of changes in discount rates on benefit-cost ratios; determination of discount rate.

**Results of Survey:** summary of agency practices; divergent agency views; significance of differing practices.

**Appendix I.** Discount Rates used by Federal Agencies in the Analysis of Individual Programs in Fiscal Year 1969.

**Appendix II.** Federal Agencies Not Using Discounting in the Analysis of Individual Programs in Fiscal Year 1969.

**Appendix III.** Illustration of Calculation of Total Cost to the Government of Borrowed Funds.

**Appendix IV.** Illustrative Copy of a Request for Information Concerning Discounting sent to Selected Agencies.

**Appendix V.** Letter Dated 19 December 1967, to the Comptroller General of the United States from the Chairman of the Joint Economic Committee.

**System and Cost Effectiveness Manual for System Developers**  
Chop, Allen

Sunnyvale, Lockheed Missiles and Space Company, 1970, 269 p.  
RADC-TR-69-358. AD 867 397.

**Abstract:** "The manual defines and describes the system and cost effectiveness management implementation process which will provide both Air Force and contractor management with the necessary mission responsive criteria, authoritative perspective, and visibility for critical system development decisions. Technical activities, procedures, guidelines, and objectives for the efficient and meaningful formulation of effectiveness criteria, and for the evaluation and assurance of effectiveness, are detailed on a step-by-step and time-phased, action basis for each of the systems management phases of concept formulation, contract definition, and acquisition. Further, the integration of the effectiveness implementation procedures with the system program management procedures and systems engineering management procedures is outlined for each major effectiveness activity and polarized with information flow networks." Air Force oriented.

- I. Introduction: general; purpose of manual; use of manual; abbreviation and definition of terms used.
- II. Implementation Overview of the System and Cost Effectiveness Technology: general; integrated system and cost effectiveness and systems management networks; system and cost effectiveness measures.
- III. System and Cost-Effectiveness Implementation for Concept Formulation Phase: general; mission analysis; specifying preliminary figures of merit; performance requirements analysis; operational requirements analysis; effectiveness parameter selection; model structuring; system and cost effectiveness analysis; report.
- IV. System and Cost Effectiveness Implementation for Contract Definition Phase: general; effectiveness analysis refinement; apportionment analysis; effectiveness progress monitoring and demonstration planning; report.
- V. System and Cost Effectiveness Implementation for Acquisition Phase: general; detail effectiveness analysis; effectiveness progress monitoring demonstration; final report.
- VI. System and Cost Effectiveness Technical Management: general; Air Force management; contractor management.
- VII. Application Guidelines for Specific Major Classes of Air Force Systems.
- Appendix A. Example of Implementation Procedures.
- Appendix B. Synthesis and Analysis Methods for Determining Transfer Functions, Outputs, and Inputs.
- Appendix C. Combination of Sensitivity Functions.
- Appendix D. Apportionment Procedures.

**System and Total Force Cost Analysis**  
**Novick, David**

Santa Monica, The Rand Corporation, 1961, 141 p.  
Rand Memorandum RM-2695-PR.

**Summary:** "This memorandum describes the aims, concepts, and methods of military cost analysis as developed by the Cost Analysis Department of the Rand Corporation. It is concerned basically with the estimation of costs for proposed military activities so that informed choices can be made among them."

- I. Aims and Concepts of Analysis.
- II. Cost Analysis of Individual Systems: investment costs (installations, equipment, stocks, initial training, miscellaneous investment); operation costs (equipment and installations replacement, maintenance, training, pay and allowances, fuels, lubricants, and propellants, services and miscellaneous; intermediate and support major command operations); R&D costs (system development, system test and evaluation, other system R&D costs).
- III. Cost Analysis of Total Force Structures: force composition and assumptions; incremental costing and long-term programming; costs as expenditures and as program requirements; mission and other lower-level cost analyses; sensitivity, timeliness, and clarity; cost categories reconsidered (investments, operations, R&D); electronic data processing; summary.
- IV. Cost Sensitivity Analysis: examples, uses and advantages.
- V. Presentation of Results.
- Appendix. Analysis of Manpower Requirements.
- Bibliography.

**A System for Development of Mathematical Models**  
**Hendricks, J.W.**

San Francisco, US Naval Radiological Defense Laboratory, 1964, 33 p.  
USNRDL-TR-749. AD 602 733.

**Abstract:** "This paper presents a general quantitative system for association of theory and observation. The system, in formulation and presentation, is directed toward the needs of the user investigator. It is well organized for use with automatic machines in the computing and information processing. A multivariate distribution approach to model construction is used in accounting for errors and other sources of variation. As usual, hypothesized mathematical descriptions are modified in accordance with the observational data. The requirement of a state of control is regarded as fundamental. The question of unidentifiability is given prominent consideration; and in this connection, the general necessity of calibration is established and emphasized. The principle of maximum likelihood is suggested as the most acceptable ranking criterion for the system; but modifications or decision-theoretic extensions are not precluded. In short, the ordinary restrictive conditions are not imposed in this system. The fundamental ideas are discussed within the contextual framework of the system. The general principles for applying the system are presented and discussed. The most important classes of models are dealt with mathematically in detail."

**System/Cost Effectiveness Notebook**  
**Harkins, James A. and Paul C. Shemanski**

Griffiss Air Force Base, Rome Air Development Center, 1969, 2 Volumes,  
663 p. RADC-TR-68-352. AD 854 651 and AD 854 652.

**Abstract:** "This notebook describes techniques by which the cost and effectiveness of modern-day weapon systems may be evaluated. It is the purpose of the notebook to present current state-of-the-art of system/cost effectiveness, to develop proper foundations for system/cost effectiveness concepts and to make recommendations pertinent to the future technological needs of the effectiveness discipline. The techniques offered are based on the results of general studies in the areas of technical, cost and management disciplines. These studies are now completed. The basic foundations for system/cost effectiveness analyses have been established, validity and practicality proven and overall feasibility demonstrated. As new and improved methods are developed and refined, the notebook will be updated."

**Systems Analysis and Policy Planning: Applications in Defense**  
Quade, E.S. and W.I. Boucher, editors.

Santa Monica, The Rand Corporation, 1968, 456 p.  
Rand No. R-439-PR (Abridged). AD 695 765.

Prepared for the United States Air Force Project Rand, this volume "attempts to demonstrate that systems analysis can and does provide knowledge that decision-makers need; that it can serve to sharpen intuition; that its usefulness is not limited solely to questions of policy and planning that can be quantified; and, most important, that whatever its weaknesses, it produces more fruitful results, of far greater consequence and reliability, than any of its alternatives. It is intended more as a sophisticated guide to users of analysis than as a manual for those to prepare such material."

- I. Introduction: definition; origins; types; essence; elements; current status.
- II. An Introductory Example of Systems Analysis (M.G. Weiner).
- III. Principles and Procedures of Systems Analysis (E.S. Quade): essence; alternatives; process (formulation, search, evaluation, interpretation).
- IV. Criteria and the Measurement of Effectiveness (L.D. Attaway): elements; three examples (overspecification of criteria, maximizing effectiveness/cost, dominance, interceptors, scale of effectiveness, suboptimization, aggregation, criteria).
- V. Uncertainty (Albert Madansky): probabilities; utilities; models; treatment (time, information, flexibility, a fortiori analysis, sensitivity analysis).
- VI. Technological Considerations (H. Rosenzweig): types of decisions; technical feasibility; selection of best technical approach; comparison with competing systems.
- VII. Resource Analysis (G.H. Fisher): definitions and concepts; context (time horizon, type of decision, scope of the problem).
- VIII. Cost-Sensitivity Analysis: An Example (P.L. Patrunchell).
- IX. The B-X: a Hypothetical Bomber Cost Study (W.E. Moos).
- X. The Nature of Models (R.D. Specht): design and use; types.
- XI. Mathematical Models of Conflict (Melvin Dresher): game theory.

**Systems Analysis for Effective Planning: Principles and Cases**  
Rudwick, Bernard H.

New York, John Wiley & Sons, 1969, 469 p.

"Although much has been written on the philosophical and intellectual level regarding the need for systems analysis or cost-effectiveness analysis as part of the systems planning process, there has been a lack of unclassified methodological material which showed explicitly how to attack complex, unstructured problems involving choice among system alternatives. This book is about the application of systematic, quantitative methods and techniques to the task of planning." Part 1: systems planning and the decision-making process (chapters 1-3); Part 2: foundations of systems analysis (chapter 4); Part 3: an illustrative example: mission oriented systems analysis (chapters 5-8); Part 4: principles of resource analysis (chapter 9); Part 5: subsystems planning (chapters 10-13); Part 6: the role of analysis in source selection (chapters 14, 15); Part 7: conclusions (chapter 16).

- I. Introduction and Overview.
- II. The Work Process for Systems Planning: background; the work process; required skills; summary.
- III. Systems Analysis as Part of the Management Process: systems planning and budgeting in DOD; the improved DOD management information system.
- IV. Developing the Systems Analysis Procedure: basic terminology; factors involved; objectives; interrelationship of models; cost model; criteria for system selection.
- V. The Strategic Force Planning Case: Qualitative Aspects.
- VI. Developing Quantitative Relationships.
- VII. Model Exercise.
- VIII. Coping with Uncertainties.
- IX. Resource Analysis: problems involved in estimating costs of required resources; units of cost; development of key principles of cost analysis; coping with uncertainty; costing; CBRM; cost sensitivity analysis.

Techniques of Systems Analysis  
Kahn, Herman and Irwin Mann

Santa Monica, The Rand Corporation, 1957, 161 p.  
Rand Memorandum RM-1629-1. AD 133 012.

Preliminary draft of Part I of a book (Military Planning in an Uncertain World), this memorandum includes the first five chapters and covers some of the contributions that systems analysis and operations research can make to military planning.

Introduction.

The Problem: design of the offense; probabilistic considerations; design of the defense; the two-sided war.

- I. Designing the Offense: models; area defense models; local defense model; airfield model; tactics; specializing and simplifying the model; expected-value models; numerical calculation of an allocation; insensitivity by design; optimal allocation and performance; the central problem; elementary economics.
- II. Probabilistic Considerations: qualitative discussion of accuracy; probabilistic model; the monte carlo technique; simulating the area defense; the monte carlo calculation; analysis of a fixed budget; results of probabilistic calculations; deferred decision operation; modelism; probabilistic objectives; deterrence vs. win the war; requirements for these objectives; sample calculation; performance under deterrence objective; performance under other objectives; high and low confidence measures; expected-value vs. probabilistic calculations.
- III. Designing the Defense: bias for the offense; general considerations; the parametric defense model; optimal allocation of a fixed budget; maximizing procedures in general; contingency planning; uncertainty in objectives; uncertainty in costs; context uncertainties; some important contingencies (magnitude and type of attack; degradation of our performance; variation in enemy's performance; chance factors; strategic and political changes; technological progress); simulating different contingencies; non-contingency planning; contingency analysis; contingency design; soft spots and time phasing.
- IV. The Two-Sided War: asymmetries (technological skill; military skill; allies; geography; resources; intelligence); objectives - two kinds of deterrence; both sides with fixed military budgets; the approximations; the two-sided calculation.
- V. Evaluation and Criticism: analysis omits (research, development, procurement, operations; scale and detail; mixed forces; unconventional tactics; time phasing; re-examination stage; unsettled questions; convincing comparison of alternatives).

Appendix 1. Graphs of Partial Sums of the Binomial Distribution.

Appendix 2. The Mathematical Model.

Appendix 3. Summary of Ideas.

**Ten Common Pitfalls**  
**Kahn, Herman and Irwin Mann**

Santa Monica, The Rand Corporation, 1957, 55 p.  
Rand Memorandum RM-1937.

A preliminary draft of a report to be included in a book (Military Planning in an Uncertain World), this memorandum identifies and discusses some of the common mistakes made in operations and systems analyses.

Introduction.

I. Modelism.

II. Statistical Uncertainty.

III. Real Uncertainty.

IV. Enemy Reaction.

V. Over-Concentration.

VI. Phasing.

VII. Over-Ambition.

VIII. Fanaticism.

IX. Hermitism.

X. Butch.

**Theory of Games and Economic Behavior**  
Von Neumann, John and Oskar Morgenstern

Princeton, Princeton University Press, 1953, 641 p.

- I. Formulation of the Economic Problem: the mathematical method in economics; qualitative discussion of the problem of rational behavior; the notion of utility; structure of the theory.
- II. General Formal Description of Games of Strategy: introduction; the simplified concept of a game; the complete concept of a game; sets and partitions; the set-theoretical description of a game; axiomatic formulation; strategies and the final simplification of the description of a game.
- III. Zero-Sum Two-Person Games - Theory: preliminary survey; functional calculus; strictly determined games; games with perfect information; linearity and convexity; mixed strategies - the solution for all games.
- IV. Zero-Sum Two-Person Games - Examples.
- V. Zero-Sum Three-Person Games: preliminary survey; the simple majority game of three persons; the general case; discussion of an objection.
- VI. Formulation of the General Theory - Zero-Sum  $n$ -Person Games: the characteristic function; construction of a game with a given characteristic function; strategic equivalence, inessential and essential games; groups, symmetry and fairness; the exact form of the general definitions; first consequences; determination of all solutions of the essential zero-sum three-person game.
- VII. Zero-Sum Four-Person Games: discussion of some special points in the cube  $Q$ ; discussion of the main diagonals; the center and its environs; a family of solutions for a neighborhood of the center.
- VIII. Some Remarks Concerning  $n = 5$  participants: the number of parameters in various classes of games; the symmetric five person game.
- IX. Composition and Decomposition of Games: modification of the theory; the decomposition partition; decomposable games; limitations of the excess; determination of all solutions of a decomposable game; the essential three-person game in the new theory.
- X. Simple Games: winning and losing coalitions and games where they occur; characterization; majority games; methods for enumeration; simple games for small  $n$ ; determination of all solutions in suitable games.
- XI. General Non-Zero-Sum Games: extension of the theory; the characteristic function and related topics; interpretation of the characteristic function; the solutions of all general games with  $n = 3$ ; economic interpretation of the results for  $n = 1, 2$ ; economic interpretation of the results for  $n = 3$ ; economic interpretation of the results for  $n = 3$ ; the general market.

XII. Extension of the Concepts of Domination and Solution; the extension, special cases; generalization of the concept of utility; discussion of an example.

Appendix. The Axiomatic Treatment of Utility.

The Use of Classical Statistics in Deriving and Evaluating CERS  
Graver, Charles

Washington, Office of the Assistant Secretary of Defense (Systems  
Analysis), 1966, 34 p.  
TP 66-8. AD 659 323.

A discussion of "some of the commonly used statistics and the differences between common interval estimates" and of the "applicability of the usual interpretation of these statistics and interval estimates in cost analysis and of the possible meanings that might be attached to them even if statistical assumptions are not fully satisfied." Specific topics: (1) assumptions of the multiple linear regression model and how well they are fulfilled in the cost analysis application; (2) least-squares estimators as "best" estimators; (3) properties of some commonly used statistics from a geometrical point of view; (4) differences in commonly used interval estimates.

Introduction.

The Model.

The Selection of a Criterion of "Best".

Commonly Used Statistics.

Interval Estimates.

**The Utilization of Military Resources**  
Smith, T. Arthur and Ogden O. Allsbrook

Washington, Department of the Army, 1967, 243 p.  
AD 824 660.

The purpose of this book is "to promote access to information generated at Department of the Army and at Army installations everywhere . . . . Take note especially of the two categories into which these articles might fall. These are the categories of idea and action. Although the separation of one from another cannot always be based on the criterion of 'in the present' or 'in the future,' this separation should be useful as a first, personnel orientation in the Army cost research program."

Introduction (T. Arthur Smith & Ogden O. Allsbrook).  
The Utilization of Military Resources (T. Arthur Smith).  
Army Operating Costs (Saul Hoch).  
The Resource Management System and Operating Cost Data (John Wallace).  
The Army Cost Handbook (Donald Gillies).  
The Impact of Electronic Maintenance Costs on Life Cycle Costs (Joseph L. Townsend & Anelie C. Yetman).  
Analysis of Combat Vehicle Operating and Maintenance Costs (Anne Rhodes & William T. Towles).  
Army Equipment Operations Costs (John O'Flaherty & Richard O'Rourke).  
United States Army Field Operating Cost Agency (Leslie R. Sears, Jr.).  
Airmobile and Infantry Division Cost of Operations in Vietnam (Joseph W. Noah).  
Criteria, Analysis, and Techniques for Estimation of Operating and Maintenance Resources (John G. Phillips).

**Weapon System Cost Analysis**  
**Fisher, G.H.**

**Santa Monica, The Rand Corporation, 1956, 20 p.**  
**Rand No. P-823.**

- I. Introduction.**
- II. Estimating Weapon System Cost:** the total activity cost concept;  
distinction between investment and annual operating cost;  
incremental investment costing; time phasing of expenditures;  
system cost components; consistency in costing method.
- III. Application to Long Range Military Planning.**
- Appendix. Figures.**

12

**Weapon System Cost Methodology**  
**Novick, David**

Santa Monica, The Rand Corporation, 1956, 52 p.  
Rand No. R-287.

**Summary:** "A method is described for estimating the costs of existing and hypothetical weapon systems of the United States Air Force. It is intended to be a quick and flexible means of establishing approximate resource and cost requirements, and it provides a basis for evaluating alternative systems in terms of both cost of a given capability and capability obtainable for a fixed cost. The method is also useful for military planning, programming, and budgeting activities."

**Summary.**

- I. Introduction: weapon system cost analysis; the role of cost estimates in systems analysis.
- II. Rand Techniques for Computing Air Force Weapon System Costs: objectives (identifying system cost elements; accumulating total cost; the distinction between investment and annual operating expenditures); present application.
- III. Description of Rand Methodology: investment cost categories (installations, equipment, stocks, transportation, personnel, intermediate command cost and support major command cost); annual operating cost categories (installations maintenance; equipment - annual replacement; transportation; personnel; maintenance; petroleum, oil, and lubricants; services and miscellaneous; intermediate command cost; support major command cost).

**Appendix.** Worksheets: manpower requirements summary; installations; primary mission equipment summary; organizational equipment summary; stocks - initial stock level; stocks - readiness reserve; stocks - aircraft spares and spare parts; transportation; personnel training; personnel pay and allowances; personnel travel; maintenance - mission aircraft; maintenance - support aircraft; POL - mission aircraft; POL - support aircraft; POL - miscellaneous; services and miscellaneous; intermediate commands; support major command cost.
